## Hydrosphere : I

- \* It is the sphere of Earth
- \* It is one of the spheres of earth which containing water bodies like river, ocean, sea etc.
- \* It covers 70% of the Earth.
- \* It covers  $\frac{3}{4}$  of the land.

    - It also consisting of rocks
  - 3) Core : Its thickness is 3500 km.
    - It also consisting rocks.
- \* Lithosphere contains naturally formed hard substance

i.e., rocks.

### 3). Mineral Matter.

- \* Mineral matter of soil is a ~~is~~ inorganic content of soil.
- \* It provides essential inorganic nutrients
- \* Soil contains ~~46~~ 45-1% of mineral matter.
- \* Mineral matter contains various rock fragments and minerals.
- \* Various rock fragments
  - 2mm - 75mm - sand
  - 75mm - 250mm - flags
  - > 250mm. - stones
- \* These various sized rock and minerals helps in the movement of nutrient in soil for plant growth.

### Organic Matter

- \* Organic matter is organic in nature.
- \* It is up to 1-6% in the soil.
- \* Organic matter is added by the soil microbes which decomposes and degrades the animal and plant residue.
- \* It should be maintained by

adding plant and animal residue regularly

- \* It increases the water holding capacity of soil.
- \* It also increase nutrient retention capacity of soil.

### 5) Soil Water

- \* Soil water is the water molecules present in the pores of soil
- \* The quantity of soil water depends upon the soil air also.
- \* It is up to 20-30% of the soil.
- \* Soil water varies due to the temp<sup>re</sup>, type of soil, presence of pores,

### Role of water in Plant Growth.

- \* Water acts as a nutritional transport medium. It is found in Xylem tissue of the plant. It supplies nutrients to the all the parts of the plant from root to leaves.
- \* Temperature Regulator ∴ water also take part in transpiration, which a process of loss of water molecules through stomata. From this process plant feel cool. and temperature of the plant is reduced.

\* Take part in metabolic activities : It take part in respiration, transpiration and other activities

\* It gives rigid structure to the plant body

\* Photosynthesis : water is essential for photosynthesis it provides Hydrogen atom that binds to  $\text{CO}_2$  from glucose.

Part - C

## 8) Types of Weathering

- 1) Physical weathering: Breaking down of rock and minerals present in it into simpler ones.

methods

- \* temperature changes: During day there is high temperature and night time temperature reduces. This exerts pressure on the rock due to the pressure weathering of rock occurs at night.
- \* salt accumulation: salt water seeps into rock cracks as the temperature rises water evaporates and salt remained there. as the time passes salt grows in cracks exerts pressure on it it results in breaking down of rock.
- \* rubbing of other rock part on the surface of rock results in weathering.
- \* Human activities like road, building construction on mountains result in weathering as they cut down the rock for their use of land.

## Chemical weathering :

Breaking down of rock and its minerals into simpler molecules. There is chemical changes also occurs.

**Solution :** Some water soluble minerals directly dissolve in water resulting into weathering.

**Oxidation and Reduction :** Some oxides and hydroxides are formed in rocks resulting in weathering of rock.

**Hydrogenation :** Hydrogen reacts with the minerals like silicon resulting in the weathering of rocks.

## Biological Weathering :

Breaking down of rock and minerals into simpler molecules by the help of organisms.

- \* **plant root penetration :** Plants growing on rocks, their roots grow in cracks of rocks, as they become grow root exerts pressure on the rock so, they result

into breaking down of rocks.

Organic acid Release : Microbes present on rocks and some plant roots ~~secrete~~ releases organic acids which degrades the soil.

ii) Nutrient Management plant.

\* Farmer should use all the types of fertilizers like, organic manure, chemical fertilizer, biofertilizers and others for good plant growth.

\* Chemical fertilizers.

Farmer should use chemical fertilizers as they provide essential nutrients quickly to the plants. They are added to soil directly.

Eg. Nitrogenous fertilizer Eg: Urea.

• Phosphorous fertilizer Eg: SSP.

• Potassium fertilizer Eg: MOP.

\* Organic fertilizers manures

These organic fertilizers made up of plant and animal residue, which maintain the soil health, increases ~~add~~ water holding capacity of soil.

Eg. Green manures

• Compost Eg: Vermi compost.

• Farm Yard manure: cow dung, poultry

• These increase the soil fertility.

• These release the nutrients slowly so that plant can absorb all nutrients easily.

• Reduces wastage of nutrients.

Bio-fertilizer

usage of beneficial microbes for plant growth.

Eg: Mycorrhiza - association plant root & fungi which perform N-fixation.

- It converts atmospheric nitrogen into ammonia so that plant can consume it.
- Azotobacter - N-fixing microbe.

Adding of Plant Residues

It is another method where plant residues are added to the soil. Soil microbes decompose it and nutrients provided to plants.

Eg: Wheat straw, Rice straw.

Chemical fertilizer application method:

They are broadcasted: spreading the fertilizer throughout the land.

Eg: Urea.

- \* Some fertilizers are provided through irrigation.
- \* Some fertilizers are sprayed to target areas.

\* Nano-Fertilizers: These are the fertilizers developed at nano-scale level using nano technology.

- These fertilizers reduce soil and water pollution
- These release nutrients slowly
- It is environmental friendly, as it reduces soil pollution & green house gases release
- Targeted delivery: They provide essential nutrients to targeted part.

Eg: Nano - urea (coated with nano silica)  
Nano - Phosphorus  
Nano - Potash.

Method of application.

applied to soil : nano - urea.

applied to targeted part : Foliar spray

Water Electrical Conductivity is important for plant growth.

EC of water.

0 - 0.7 - Excellent for crop

0.7 - 3 - Good for crops

3 - 5 - Marginal crop can sustain

> 5 - Bad for crops.

\* Irrigation is Important step in agriculture.  
pH of water is 6.5 - 8.5 is ideal for irrigation.

\* Some of the chemicals which correct the soil problems are.

Gypsum - Improves sodic soil

Lime - Improves acidic soil

Sulphur - Reduces pH of sodic soil.

\* If water EC is more.

- Use more water to reduce salt accumulation.
- Select the marginal crops.
- Mix the water with good quality of water
- Use drip-irrigation method. so salt accumulation reduces.

9). Soil Density : Mass per unit volume of soil.

Particle density : Mass per unit volume of solid particles of soil

- \* It does not include pores in it.
- \* It does not depend on size and arrangement of particle.
- \* Particle density of organic matter rich soil is low.

Bulk density : Total mass per unit volume of soil including both particles and pores.

- \* Bulk density is high in (clay soil)
- \* Bulk density is low in sandy soil.

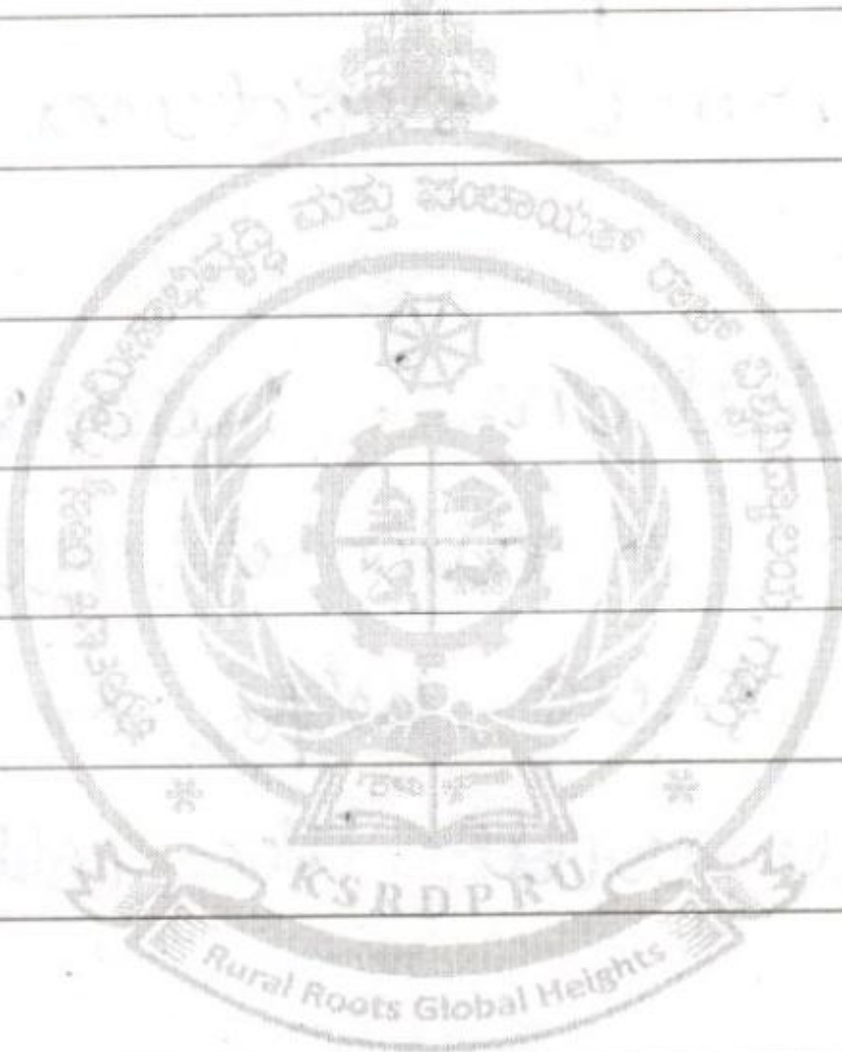

These densities help in soil strength, which means opposition of soil to deformation.

- \* These it helps in plant growth
- Gives good soil strength.
- Movement of water from particles to particles which enables the plant

growth.

\* Nutrient supply : helps in nutrients supply like N, P, K, Mg, Zn, S. which are essential for plant growth.

\* Provides good base for plant growth.

## 10) Soil Organisms

- \* There are lot of soil microorganisms in soil.
- \* These soil micro-organisms help in nutrients cycling.
- \* microorganisms present in soil :
  - Bacteria : They help in N-fixation, Nutrient mineralization.
  - Fungi : They help in decomposition of plant and animal residues, help in soil aggregation
  - Symbiotic associations : Mycorrhiza, and others help in fixation of nutrients.
  - Actinomycids : They help in decomposition of tough cell wall like cellulose and lignine.

## Functions of Microorganisms present in soil

- Nutrient cycling : Microorganisms like Mycorrhiza, & others help in nutrients cycling like N, C, P, S cycles.
- Organic matter decomposition : Fungi and others help in decomposition of

plant and animal residues.

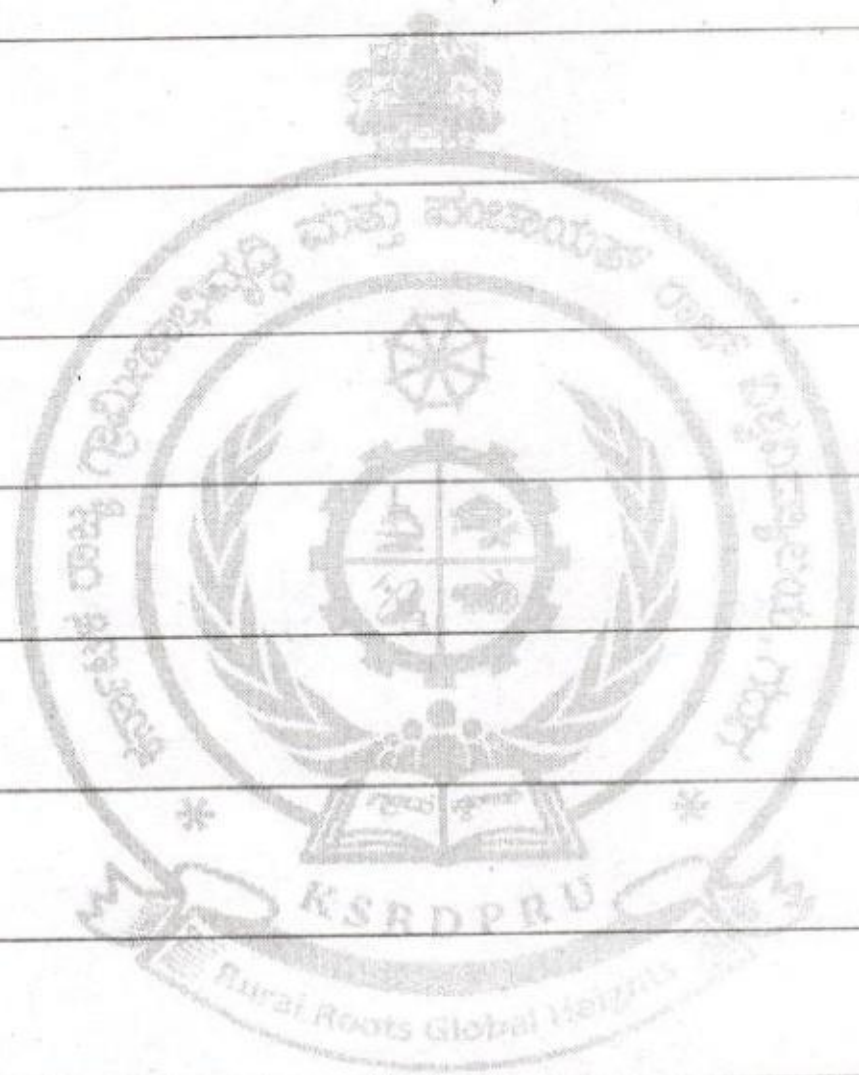

- \* Soil structure & aggregation: Fungal hyphae helps in soil particles aggregation, and improves soil structure.
- \* Disease suppression: Bacterial and fungal hyphae secretions provide antibiotics to the plant to fight against disease.
- \* Increase water holding capacity of wet soil
- \* Does not pollute the air, water and soil as the chemical fertilizers do.
- \* Organic manures are made with the help of soil microbes. They do reduce the dependency on chemical fertilizers.
- \* There is no wastage of nutrient as they release the nutrients slowly.
- \* Micro-organisms increase the soil-fertility soil-physical, chemical, biological structure.

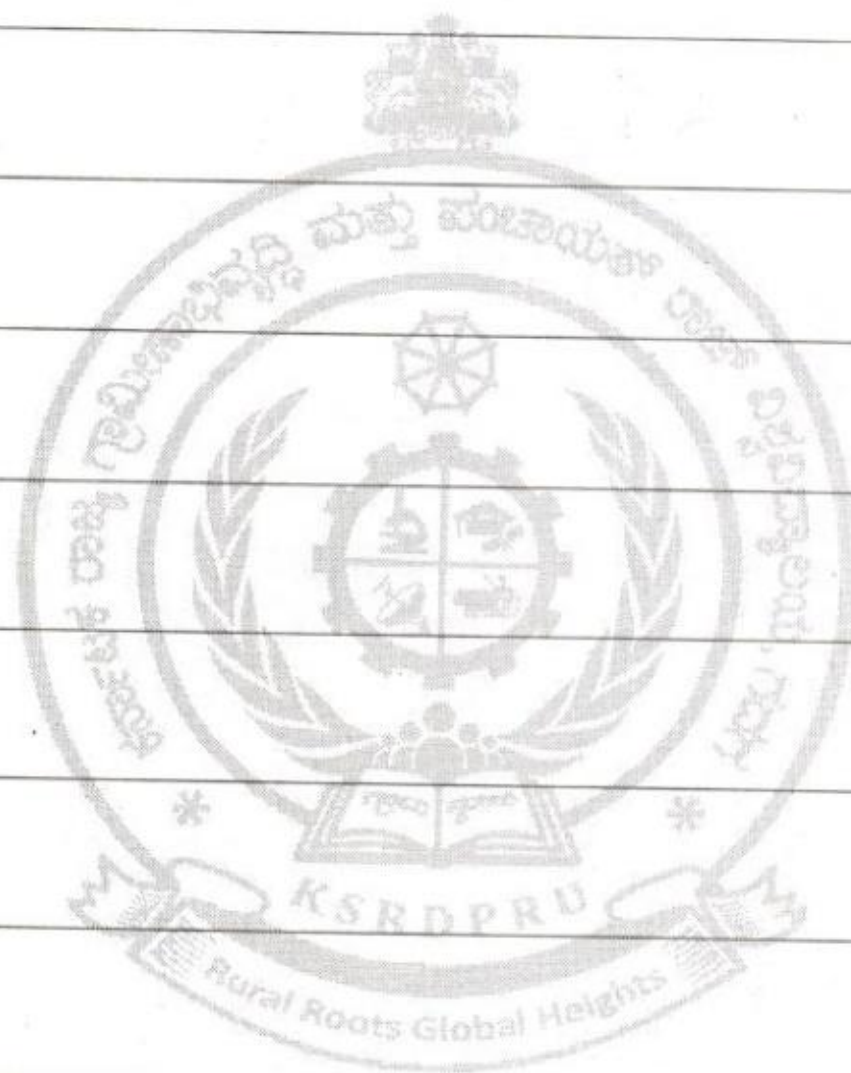

micro-organisms

Supports sustainable agriculture :

- Microbes improve the soil quality
- Microbes improve water holding capacity
- Reduces dependency on chemical fertilizers as they do pollution.
- Doesn't pollute soil and water.
- Increase nutrient efficiency as they release nutrients slowly.
