(a) Numerical Aperture :-

Numerical Aperture it is a parts of the Eukaryotic cell and prokaryotic cell it includes a Numerical Aperture it is tiny like structure which includes Numerical Aperture.

(b) Ribosomes :-

Ribosomes is present in Eukaryotic cell and it is helps to maintain the cell structure and Ribosomes are tiny like structure which act a virtual Role in a cell.

(c) Chemotherapy :-

Chemotherapy it is a therapy which the Microbes and the Micro Organisms is acts a Chemical Substance. is called Chemotherapy.

(f) Flagella:-

- Flagella is located on the outer body of the prokaryotic cell.
- Flagella helps to move a fluid contain of prokaryotic cell.
- Flagella is a long hair-like structure.

(d) pure culture:-

- pure culture means it is a standard method of the microbial. It includes how to maintain and preserve the microbial pure cultures. pure culture is a cleaning, storing, and maintaining. Nutrition is called a pure culture.

(e) Mycelia:-

PART:- B

2. The structure of prokaryotic cell :-

The Structure :-

The Structure of prokaryotic cell :-

Prokaryotic cell includes :-

- Mitochondria
- Cytoplasm
- chromatids
- Flagella
- Cell Envelop.

- Cell wall
- Cell Envelop.
- Cilia

⇒ These are the parts of prokaryotic cells:-

- prokaryotic cell does not having Nucleus.
- prokaryotic cell is larger than the eukaryotic cell it is the larger in size.
- prokaryotic cell is made of up chink.
- prokaryotic cell is always larger than the eukaryotic cell.
- Prokaryotic cell it does not having Nucleus it
- The prokaryotic structure is different from the other structure.
- The prokaryotic structure is one of the different and fine structure.
- The prokaryotic is having a many parts and we will see in this.

Parts of Prokaryotic cells:-

- The prokaryotic cell having a cell wall.
- Cell wall:-
 - Which acts as a outer covering of the cell.
 - Cell wall plays a important role in the prokaryotic cell because it covers the outer body of the cell. [prokaryotic.
- It also having Outer Membrane which plays a virtual Role and Outer Membrane of (cell) prokaryotic it is.
- Then it is having cell Envelop. it is also acts has a virtual role in covering the Outer body of the prokaryotic cell.
- Mitochondria:-
 - it is a Mitochondria helps in the prokaryotic cell that the it controls the transport and makes the cell transport easily.
 - Mitochondria helps in the memory power of the cell and Mitochondria is located on the prokaryotic cell that it involves tiny structure and helps to maintain the transport and movement in the prokaryotic cell.

Cilia

- It is the Outer part of the prokaryotic cell that it includes the thin hair like structure that helps to swim the cell from one part to the another part.

- cytoplasm.

- Cytoplasm is also present in the prokaryotic cell. It helps in Maintaining of the fluid flowing in the prokaryotic cell.

- Chromatids :- It is a present in the Middle of the prokaryotic cell. it is Chromatids.
- It is helps in the storing Memory of prokaryotic cell.

- Flagella :-

- Flagella is located in the Outer body of cell the cell and it maintain and helps in the floating of the prokaryotic cells.

7. On working principle procedure and application Scanning Electron Microscope and Transmission Electron Microscope.

⇒ Electron Microscope In Electron Microscope short beam of electrons and magnetic condenser lens and magnetic condenser lenses are employed to produce the microscope.

- The Electron having a short wavelength which helps in interat resolution respectively
- It is possible to resolve objective as smaller as $10^4 \text{ \AA}$ which is 100 times more than that of the light Microscope that of light Microscope it can magnify object up to $200,000 \times$
- Electron microscope is a short tungsten of a filament forms in the ≈ 50 Microscope Electrons.
- Object and the placement in the nother Microscope Electrons.

The vacuum magnified condenser lens than the casts the primary microscope. A second microscope important lenses amplify and this image is viewed on the larger screen overcaptured by the photophic plate.

a) "Transmission Electron Microscope"

b) Scanning Electron Microscope

a) Transmission Electron Microscope

- A high voltage established b/w the filament and the anode accelerates the electrons forms hot and tungsten filament and the electrons beam of placement on the specimen must be prepared since electrons can penetrate the since electrons can penetrate matter only in a short distance.

Transmission Electron Microscope project to the image onto the tungsten fluorescent and the Transmission Electron Microscope is a the microscope that contains a [TEM] Transmission Electron Microscope.

The TEM offers resolution and higher magnification than light and scanning heavy microscope such as the TEM that require platinum and uranium tungsten can increase contrast. All staining - staining

b) Scanning Electron Microscope

The specimen is coated with the heavy metal and the specimen thin and heavy metal and the specimen is subjected to the narrow beam of light rapidly moves and scans the surface on the specimen depending upon its physical and chemical composition of the release secondary electrons are then collected to the by the outer single then the single electron is scanned in the system to provide a specimen kept under high vacuum on the tungsten on the electron beam of light.

The capacity of the electron have low penetration capacity hence the solution and staining have been done which the time cone and the structure cone have been hence ultrathin then the penetration is done in this scanning the electron microscope

11 The detail on working principle of Simple Microscope:=

- The Simple Microscope is present in the light Microscope
- The light Microscope having two types that are
 - i) Simple Microscope and another one is
 - ii) Compound Microscope.
- Light Microscope is a Outer Corner of the Microscope which involves both the Simple and Compound Microscope.
- Simple Microscope:- It is a Simple Microscope having bi-convex lens.
- Which is Magnified at very low Concentration.
The Simple Microscope is having only one type of Convex lens that we can see a low quality specimens.
- The specimens we can't make a large and it can't be seen properly.

The Simple Microscope is having only one type of convex lens that we can see low magnified lenses. and in the Simple Microscope the name itself says that the Simple Microscope it involves only one bi-convex lens and helps in the prokaryotes. The specimen there is a glass plate which we can put the specimen on it.

Role of working of the Simple Microscope.
It works under the principle of the light. Electro Microscope and plays an important role in the Simple Microscope.

- The Simple Microscope works in the proper way that the Microorganisms we can see in the Microscope is into the bi-convex lens and it is a way to see in the proper magnified lenses and it plays a role and then the specimen can see clearly as much as it possible.
- The Simple Microscope is a Microscope which we can see the length of the Microorganisms. in the specimen not clearly but the magnifying with in the type of the Microscope.

- It is not so much pure and cleared image as compared to the Compound Microscope.
- Simple Microscope is very much better and Compound Microscope is also better ~~in~~ than the Simple Microscope.
- Simple Microscope is having stage arm and bi-con
nex lense and then injection joint and it
acts a zooming the Microorganisms. and seeing the
Specimens in the Magnified Specimen.
- In Simple Microscope the Specimens are not clearly
seen but it can be seen in a manner way and the
Simple Microscope is also better in the seeing
Microorganisms and plays an important role in the Micro
Organism and in the Simple Micro Organism and
the Micro Organism we can see in the Simple
Microscope.
- Simple Microscope is the Microscope that we can
see the Specimens clearly and perfectly than the
other Specimens. And it is in the Magnified
Specimen and in that we can see a clear
Specimens. and in the Magnified way

8. The Bacterial growth Curve:-

The Bacterial growth curve references to the growth of the Bacteria in a particular time and the shape of the Bacteria growth,

diagram:-

The Bacteria growth levels we can see in this diagram. The Bacteria growth curve reference to the growth of the Bacteria that plays a important role to know the stages of bacteria.

There are four stages are there they are

- 1) lag Phase
- 2) log Phase
- 3) Stationary phase
- 4) Death phase.

1) The lag phase :-

- Here the Bacteria are in the growing stage from one phase to the another stage. of the Bacteria can grow in a lag phase but in a unique way that the lag phase can grow Exponentially.

2) log phase :-

- As we seen in the diagram the log phase is growing and growth of the bacteria is less as compared to the lag phase.
- Here the growth rate is very much low.

3) Stationary phase

In the stationary phase the growth rate of the bacteria is stable and the bacteria can't be grown and the bacteria growth rate increases and the stable it is stable and maintains the growth rate.

➤ Death phase

- In the Death phase the number of Bacteria is dying, and the Death phase is completely decreasing.
- In Death phase the number of bacteria is decreasing.
- As compare to the stationary phase the Death rate is increasing.

4. The short on the General characteristics of fungi.

- The fungi are the Eukaryotic cell that it grows on the dead and decaying animals and plants.
- It fungi normally grow on the animals and plants they are dead. the animals and plants which they are dead on that it will grow.
- Fungi is not having any nucleus and it is Eukaryotic cell.
- Fungi is a Unicellular Organism.
- Fungi Microbes is Multiple.

Fungi is majorly in the day to day life.

- Fungi are grown in the dead and decaying materials
- Fungi does not having any structure accurately
- Fungi is the one of the most important factor of the kingdom.
- Fungi is majorly small in size 0.1 to 0.2um
- Fungi are majorly studied in the Eukaryotic cell.
- Fungi are made up of the Microbes is called Spore chitin.
- Fungi are grown in the animal & plants of dead & decaying plants & animals.

Fungi are grow in the bread also.

5. The Suitable Example the industrial use of bacteria.

Bacteria:-

Bacteria is very Much use full in the Industries because the one of the Most popular Example is lactobacillus:- In the Milk products the bacteria called lactobacillus is used in the industries to know the usefull of the bacteria.

The bacteria called lactobacillus is usefull in the separating the Cream and the Milk in the Industrial.

In Industries many bacteria are been used for the propose of cleaning and maintain the nutritional value and to prevent the taste also obtain the taste also the bacteria is been used in the Industries.

In Industries the bacteria is used like lactobacillus and the spirococcus, and lactococcus and many other bacteria are been used in the Industries.

for example *Lactobacillus* it is a bacteria used
in the Industry to Make the Milk
Separating of Milk and Cream.
