PART- A.

- c) Skin - a) Acts as 'physical barrier' that inhibits entry of pathogen and also prevent from physical injuries and keep the internal organs safe.
- b) - Acts as 'storage' → That stores fat cells beneath it and have heavy blood supply to the dermis layer, but doesn't have blood supply for its upper part epidermis.
- d) Arteries are the blood vessels which carry and circulate 'oxygenated blood'.
Whereas veins are the blood vessels that carry and circulate 'deoxygenated blood'.
Thus, to understand the difference in any anatomical and structure related diagrams arteries are indicated or coloured with red colour whereas, veins are indicated or coloured with purple/blue.

e) Neuron is a 'nerve cell' of nervous system present in 'central nervous system'. It is a most essential nerve that receives the stimulus/function than process it and further sends electronic impulse that carry response and these response saves organism and increases survival rate and from injuries too.

f) Urinary system mainly consist of

- Bean shaped pair of kidneys
- Urinary bladder
- Ureter
- Urethra.

b) Tissues are group of cells that have particular structure and function

- Epithelial tissue → consist thin and slightly flat cells
- Cuboidal tissue → consist cuboidal cells
- Columnar tissue → consist columnar cells
- Nervous tissue → consist nerve cells

PART-B.

7) Biomedical Importance of proteins -

Introduction - Proteins are the most crucial component to the body as many proteins play important role in hormone production, antibodies production, muscle building and many protein centered test are crucial in Biomedical field to ensure proper and ~~ade~~adequate availability of protein or amino acids.

Explanation - 'Proteins which are macromolecules of amino acids' and are product of adjoined ~~prote~~ amino acids in surplus amount.

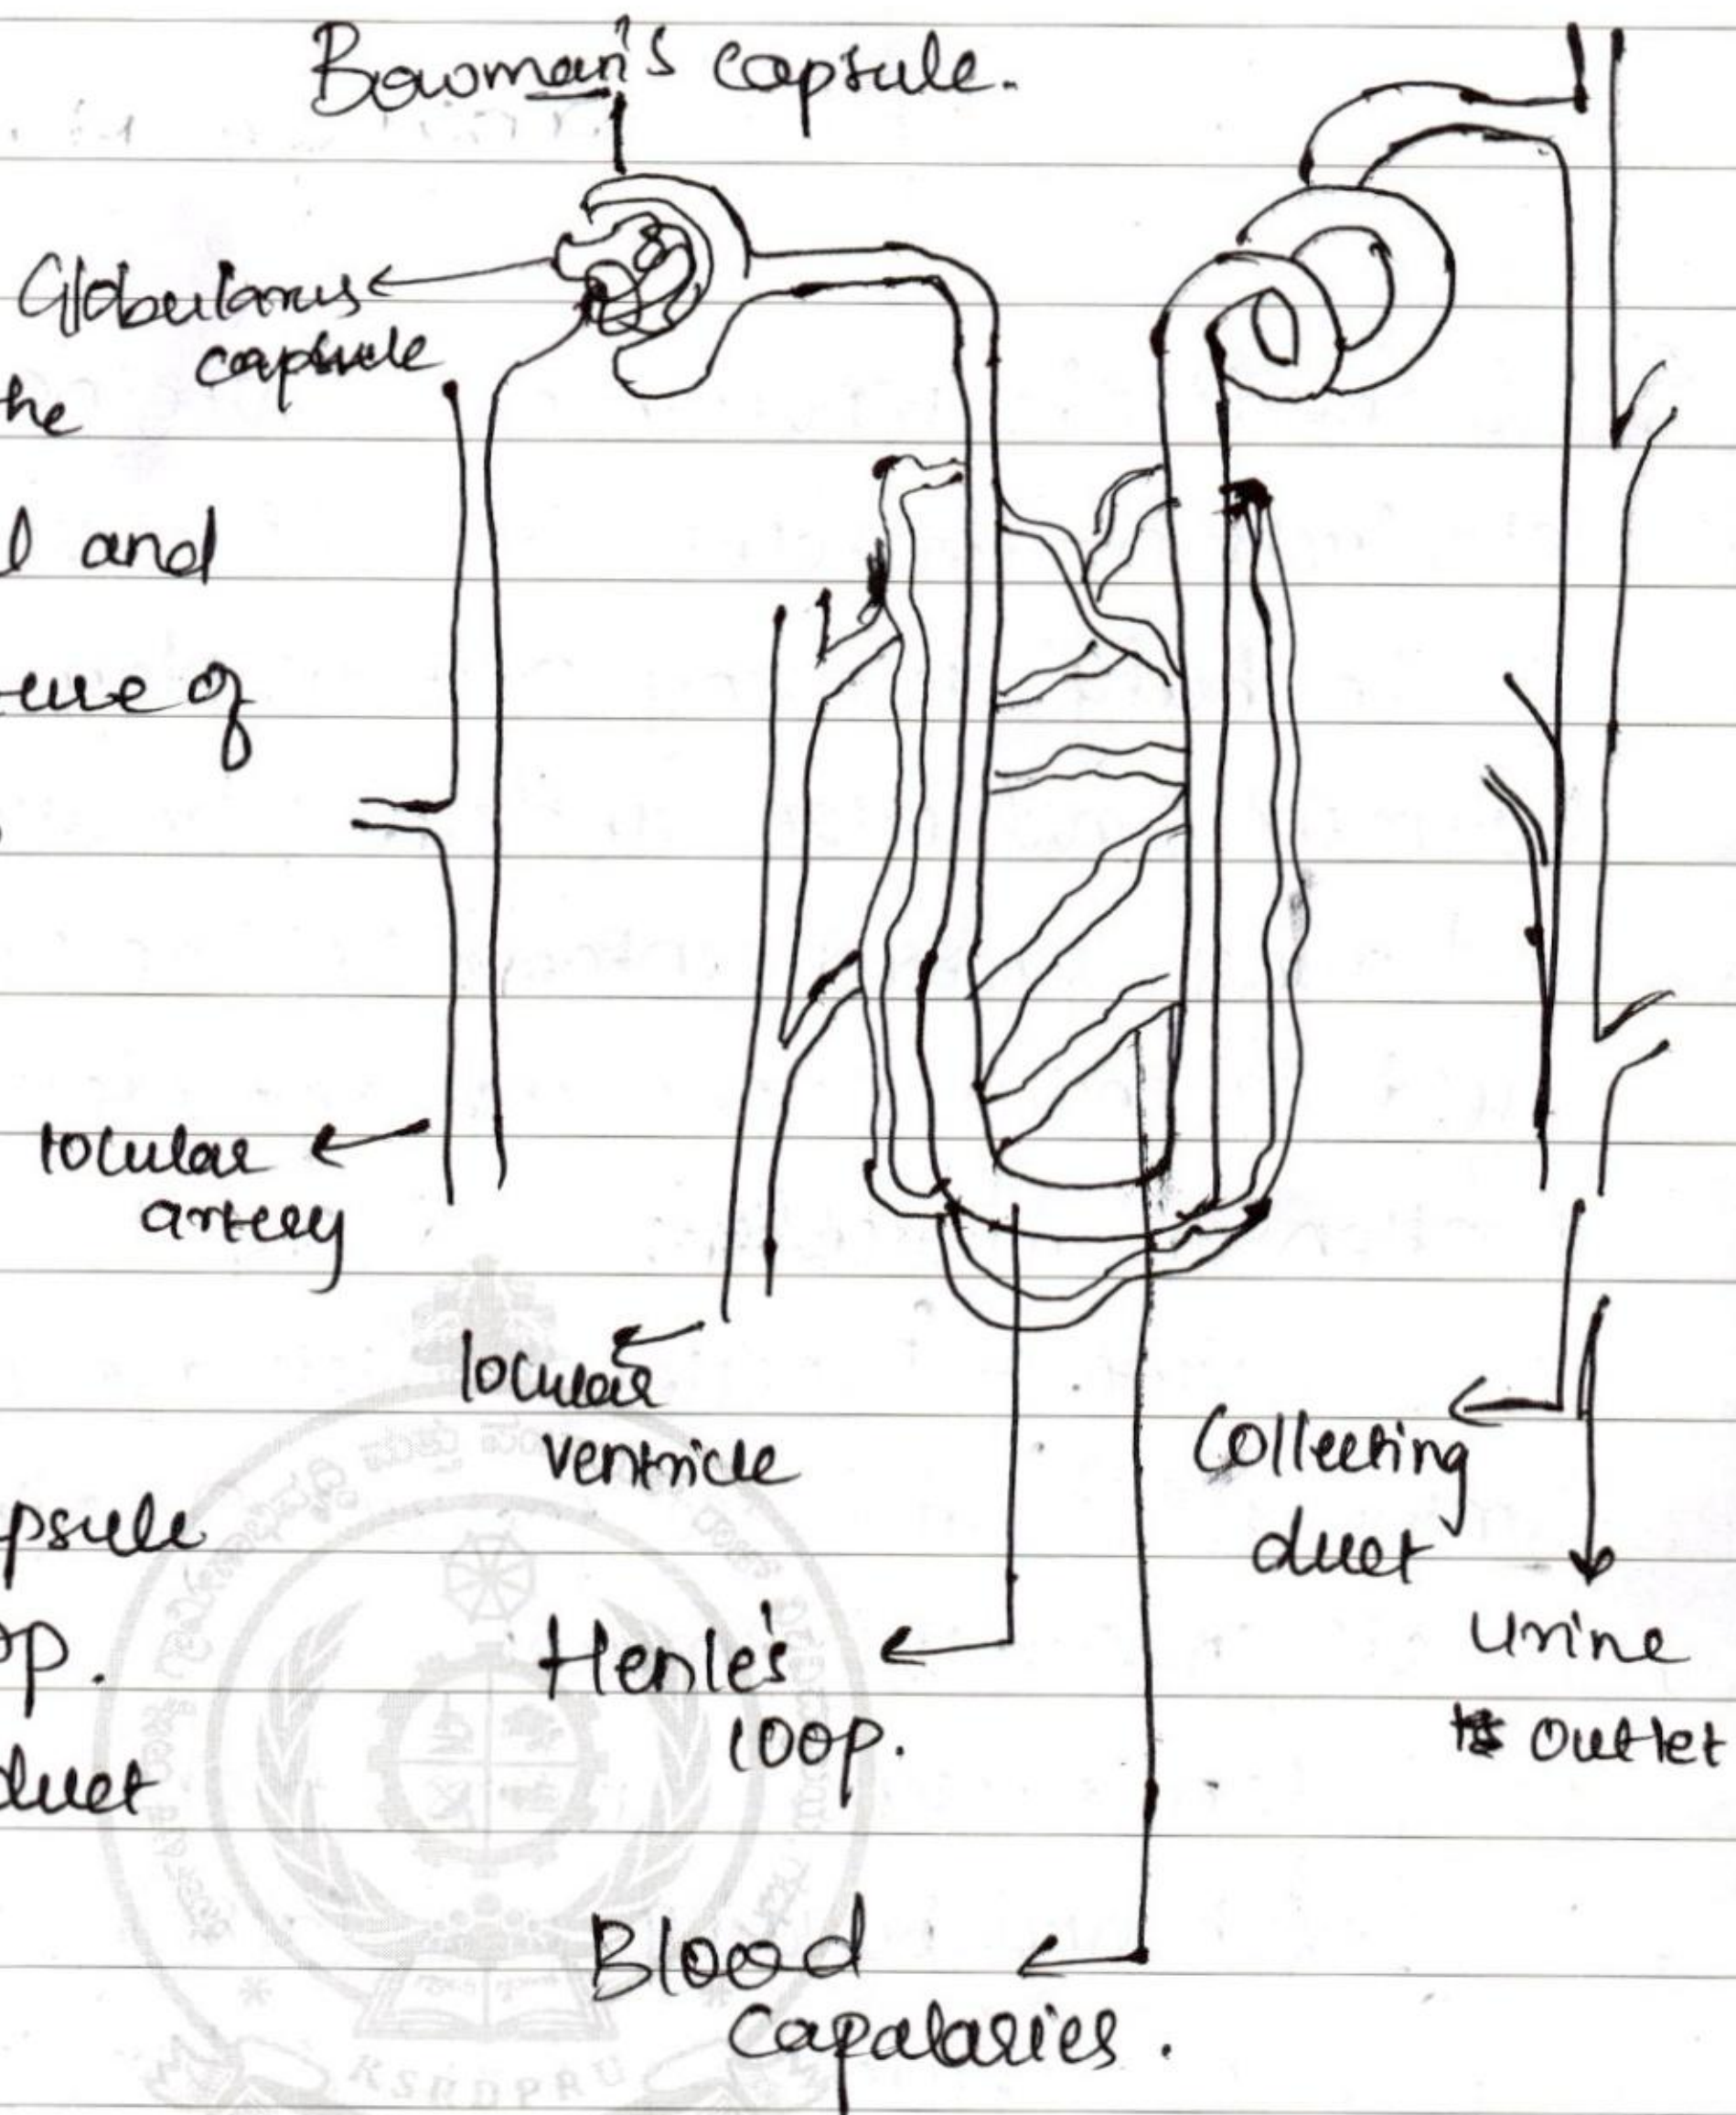

- Protein's presence ensure proper and regular body growth and building and lackney of protein cause protein deficiency disorders like Kwashiorkor and marasmus.
 - Antibodies which rescue body from pathogenic or antigens are 'proven to be proteins' many a times.
 - Even proper levels of hormones and its regulation is conducted by protein and amino acids.
 - Specific proteins attach to the cancerous cells thus enables the 'biomedical researcher to identify tumor' type based on protein present it. thus proteins are crucial in detection of tumors and cancerous cells.
- Thus, proteins play a wide variety role in Bio-medical detection and body functions.

2

Nephron

→ Nephron is the main structural and functional structure of Urinary system

→ mainly consists of
 → Bowman's capsule
 → Henle's loop.
 → collecting duct

Purification of blood / filtration take place through 3 main stages.

- Globular filtration - where blood rushes with high pressure carries all solvents and urea to capsule and forms 'Globular filtrate'.
- Tubular absorption - Here the vital components like bicarbonates are reabsorbed from the filtrate to balance body's electrolyte system.
- Tubular secretion - Its opposite of absorption where harmful components like K^+ , H^+

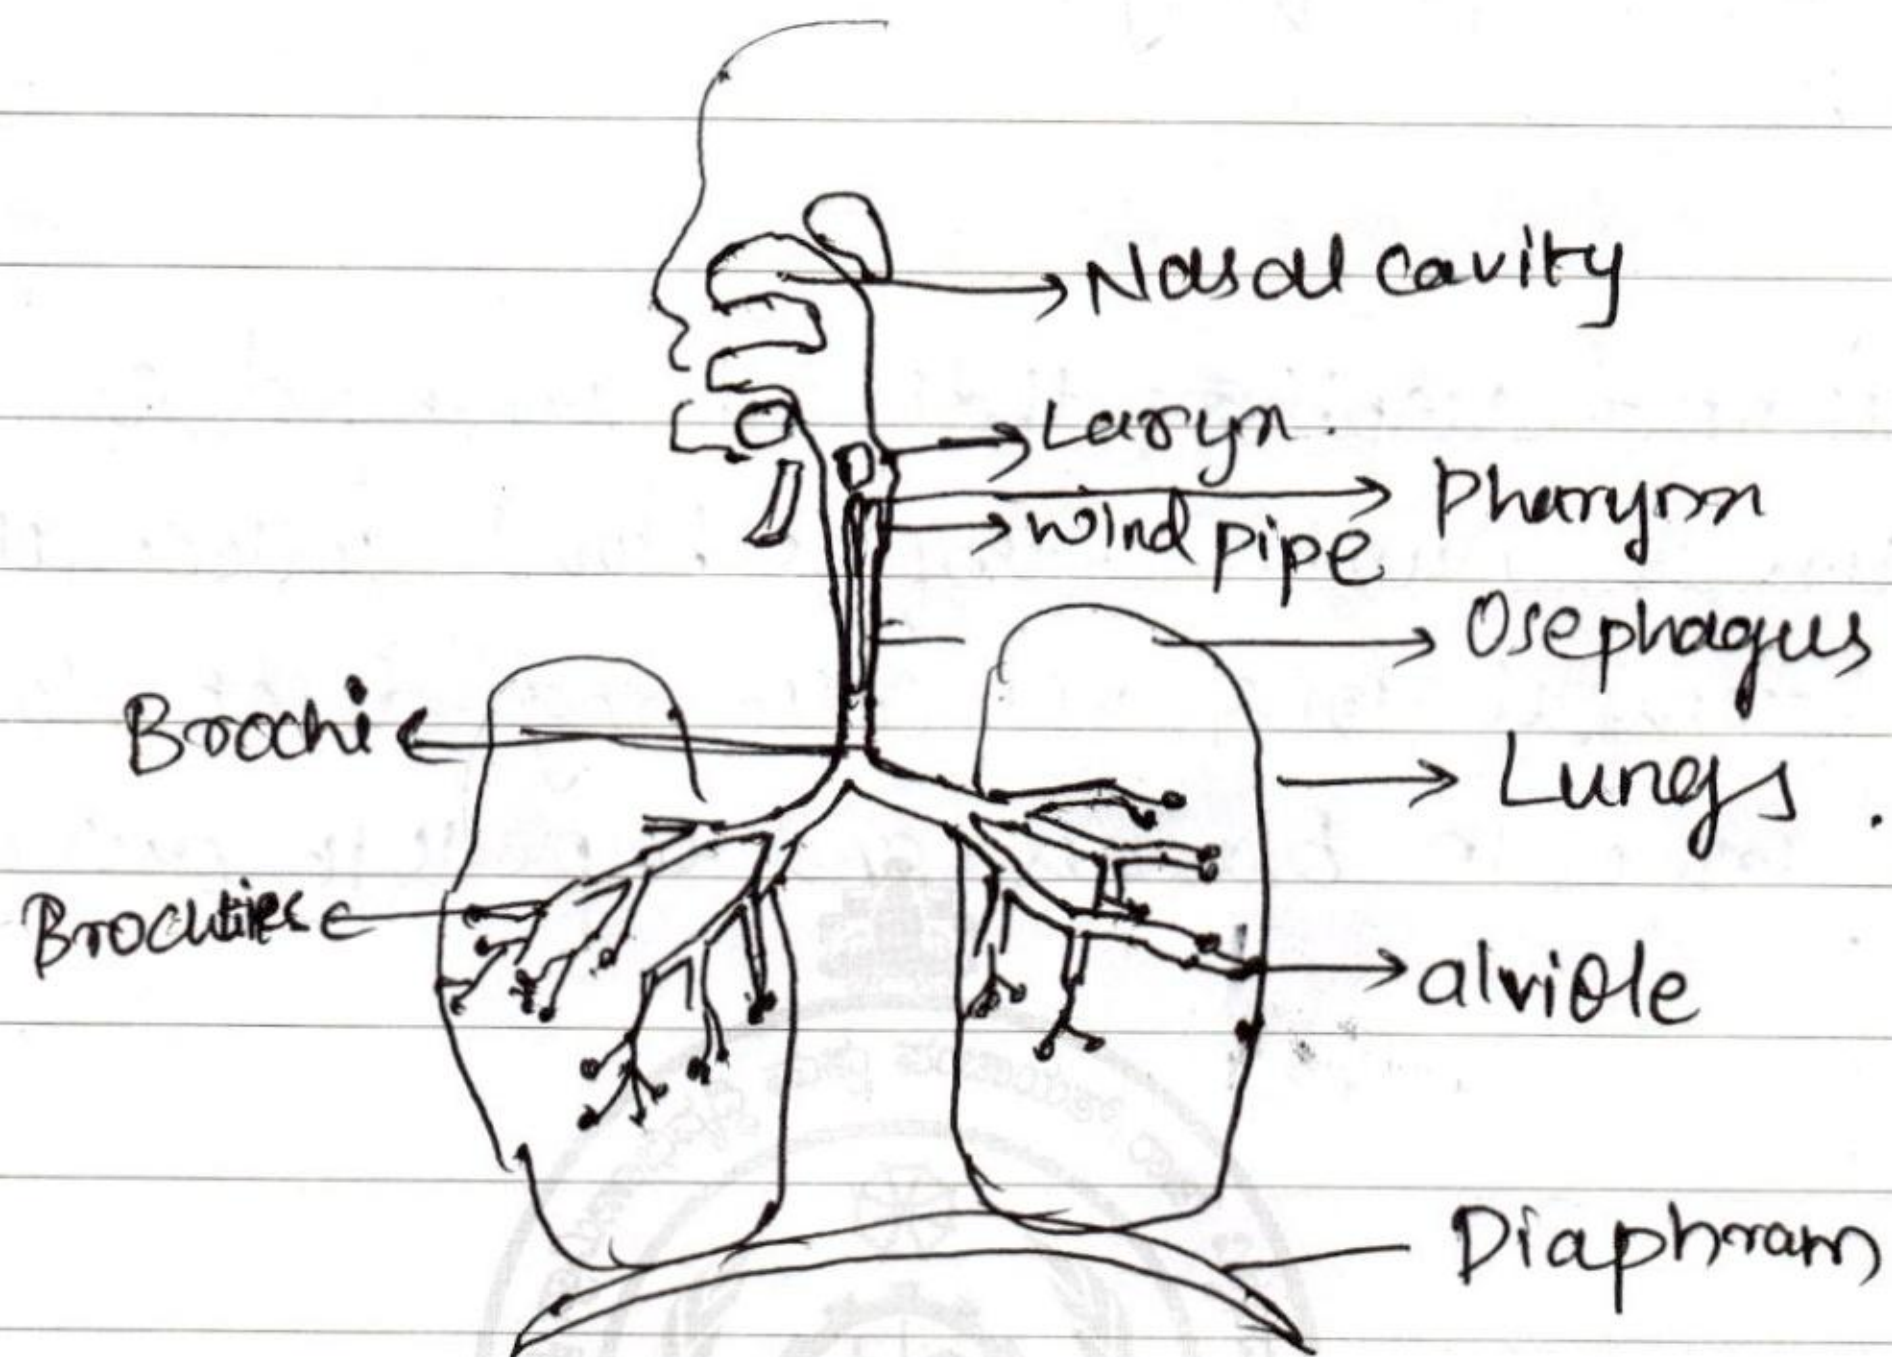

4) ~~Pituitary and thyroid glands.~~

and excess component are secreted back and sent out via urine thus purifying blood from urea and other harmful ions.

Conclusion - Nephrons that are arranged so compactly and in surplus number purifies blood collect all the urea and harmful ions via collecting duct finally store the urine in bladder and expels it out at last.

6) Respiratory System.

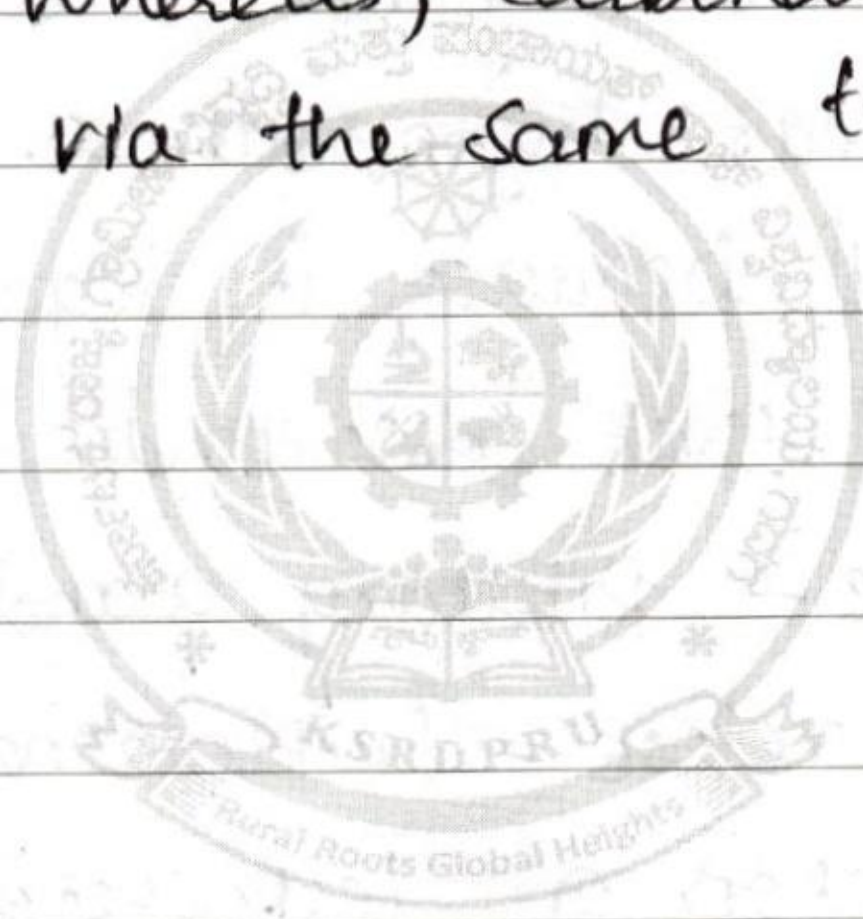

Respiratory system helps in breathing and gas exchange which starts from 'Nasal cavity' - that moisten air and remove dust particles via 'nostrils' or 'nose hairs' and regulates air into body temperature and let it in. The inhaled air surpasses 'larynx', 'pharynx' and via 'wind pipe' divide and enter 'left lung' and 'right lung'. The wind pipe further goes on decreasing its diameter and forms 'bronchi' and at the end they turn ^{into} very small diameter and connected to 'alveoli' that are sac like structures.

→ p.T.O.

These small tiny sac-like structures are very essential for gas exchange and are also called 'functional units of lungs' because the actual exchange takes place here and the part that starts from nasal cavity is just a circulatory pipe.

The ~~oxygen~~ oxygen component and carbon dioxide are separated and further oxygen is added into blood streams whereas, carbon dioxide is expelled out again via the same track.

4) Functions of pituitary and thyroid glands.

Introduction - To start with pituitary and thyroid gland its crucial to understand where they fall under i.e - 'Endocrine System'

This system secretes and regulates many hormones and influence body's overall development and appearance.

Explanation - pituitary glands located in the central nervous system near hypothalamus. and also known as 'Master gland' because it regulate and instructs other subglands that come under it.

Example in male - Pituitary gland instructs the hypothalamus to release - Luteinizing hormone that helps in production of testosterone and also guides to release follicular stimulating hormone that support testosterone in production of sperms that is 'Spermatogenesis'. Similarly in females it regulate and guide release of follicular stimulating hormone to produce ovum and even estrogen and progesterone.

Thyroid gland - location near the larynx and placed inside the butterfly shape cup like structure thus, also called butterfly gland in general usage.

- Thyroid gland mainly release T_3 and T_4 and thyronine hormone.

- These hormones are very crucial in metabolism regulation and reproductive health -

metabolism regulation includes - metabolism of carbohydrates and if altered may cause many thyroid problems like goiter, PCOS, PCOP and make the female infertile to produce babies.

PART-C.

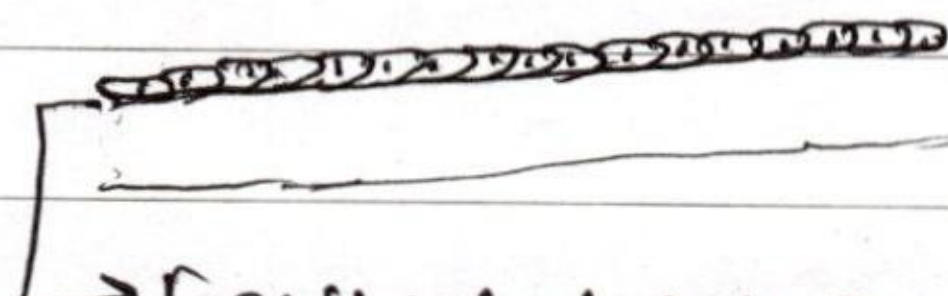

- ⑧. Levels of Structural Organization of human body and body system with example.

Introduction - Body can be divided into levels of organization like Cellular organization, Tissue level organization, Organ level organization, and Organ system level of organization.

and body system further consist of many specialized organ system organization that performs particular function and have distinct structure. and are regulated by specific enzymes and hormones.

Cellular level organisation - similar cells and that have almost same function work together and placed in group and have distinct position example.

Epithelial cells are the outer most lining that have similar function of "protection" and resemble each other in structure they are single layered and thin-flat cells.

→ Epithelial cells arranged in outermost layer.

tissue level Organization - Cells of similar ²⁹⁸¹³ function and structure together in surplus amount forms tissue level System example - Nervous tissue - where all the nerve cells connect and work together.

Organ level - tissue together in a particular place forms organs example Cardiac tissue which are involuntary and non-striated come together and form forms 'Heart' - a Muscular Organ.

Organ system level - many organs together that work for a single outcome like 'Digestive System' - that consist - Stomach, small intestine, large intestine, duodenum, rectum and anus these all organ work for digestion and excretion purpose thus forms Organ System i.e. - In this example digestive system.

BODY SYSTEM - mainly consist of

- Nervous System
- Respiratory System
- Gastrointestinal System
- Excretory System.

Nervous system - a very crucial system²⁹⁸¹³ that consist 'CNS', 'PNS', Neurons and Spinal cord which helps in processing information and give feed back and also helps in information storage.

Respiratory system - consist lungs, pharynx, larynx, wind pipe mainly 'Alveoles' that helps body in oxygen intake and CO_2 excretion.

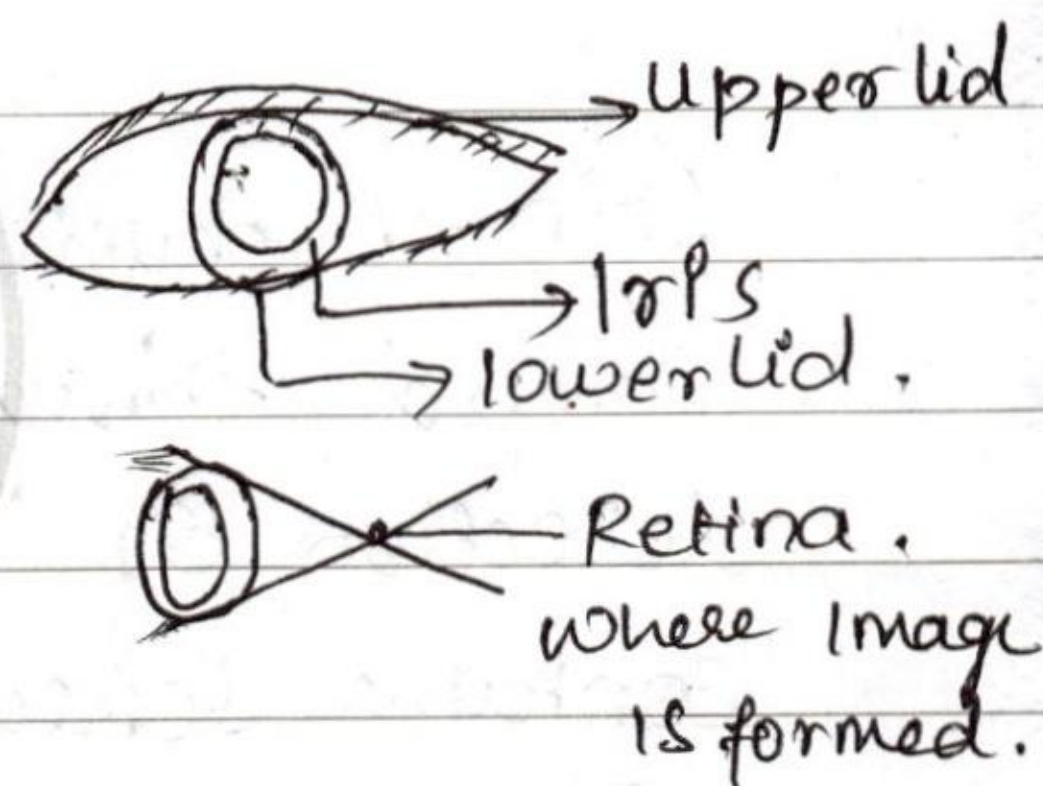

Gastrointestinal system - consist many enzyme releasing accessory glands and stomach and large intestine and small intestine that helps in digestion and reabsorption and even ~~slightly~~ in excretion.

Excretion system - mainly called urinary excretion system and also feces excretion and its a last part of oesophagus and finally pulls out urea and solid waste out of body.

⑨ Sensory Organs.

Introduction - Sensory organs are the specialized and structural organs used to detect many stimuli around us - stimuli include - fragrance/~~odd~~ odour, visions, pain or touch, sounds etc. These are essential to detect what is going around the organism and prepares it to respond like flight/fight mode also to respond and adjust to the surroundings.

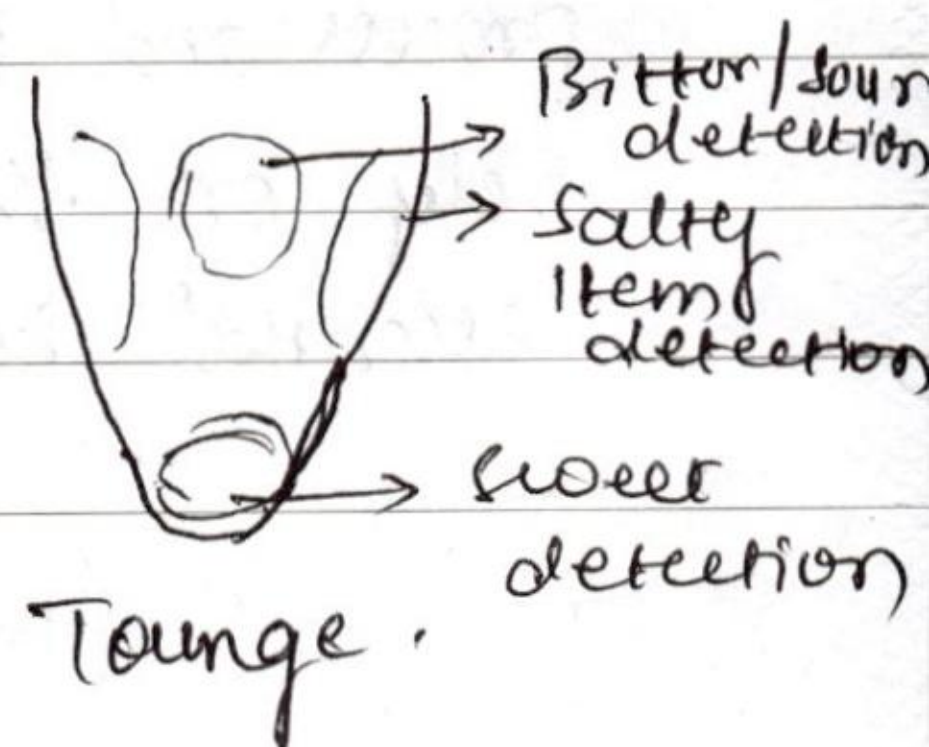

Eye - Detects the light entering to eye via iris and produces its image on retina via eye lens. Thus helps in sensing images and seeing around us.

Olfactory Indicators present in Nose.

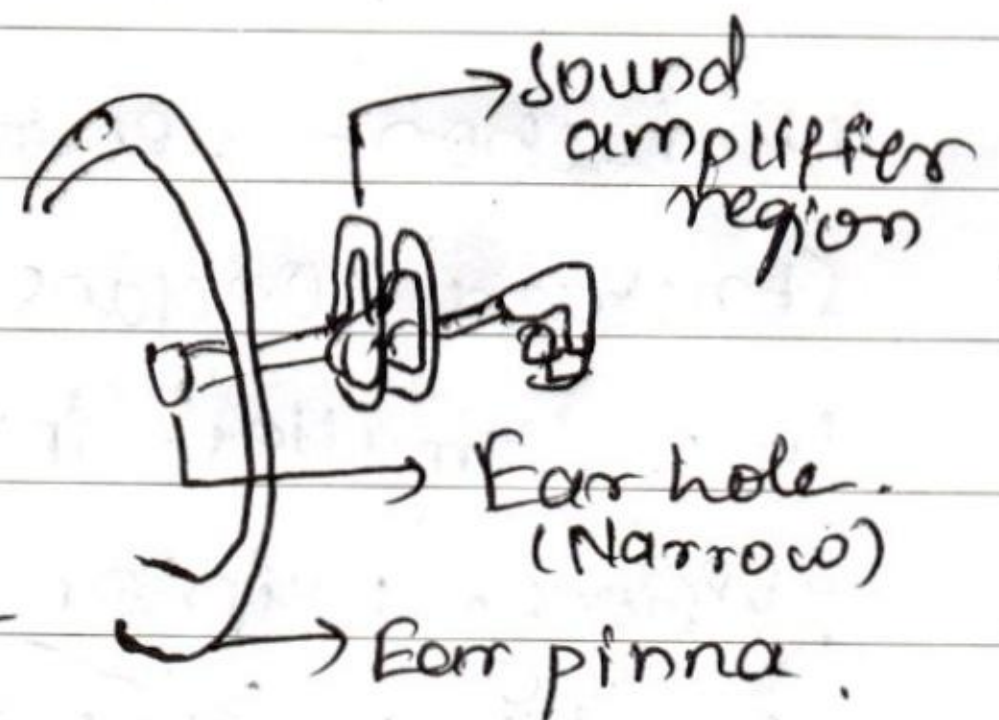

→ detects the smell around the surrounding and converts it into signals and sends to CNS and CNS detects the smell type on its previous memory.

Tongue is a smooth muscle that comprises of taste buds and help in food item taste detection. It has some specified space to

detect specific taste like salty ²⁹⁸¹³ detection region, sour/bitter detection region, sweet detection region.

Ear - A specialized structure to absorb sound around us and the pathway amplifies the sound and further there are 3 main small structures

and make the sound vibration into electrical signals and transfers it to Brain, thus helps us detection and identification of sound.

Skin - A physical barrier that is completely covered throughout the body and helps in detection of touch, pain, temperature as it contains sensory cells, then passes the information to motor cells and mostly accumulate in CNS/spinal cord that process and give feed back. back to motor cells and initiate the response.

Conclusion - Sensory organs depend on CNS to process and to get back the response and CNS rely on these sensory organs to continue to essential body functions.

12) Role of pH and water in maintaining homeostasis in the human body.

homeostasis is a process where body controls and regulate pH levels, water-electrolyte balance and temperature balance.

pH and water regulation and reabsorption is very crucial when body runs out of water content and when sometime face pH alteration.

There are two types of feed back mechanism in body that bring back body to its original balance - positive feed back.

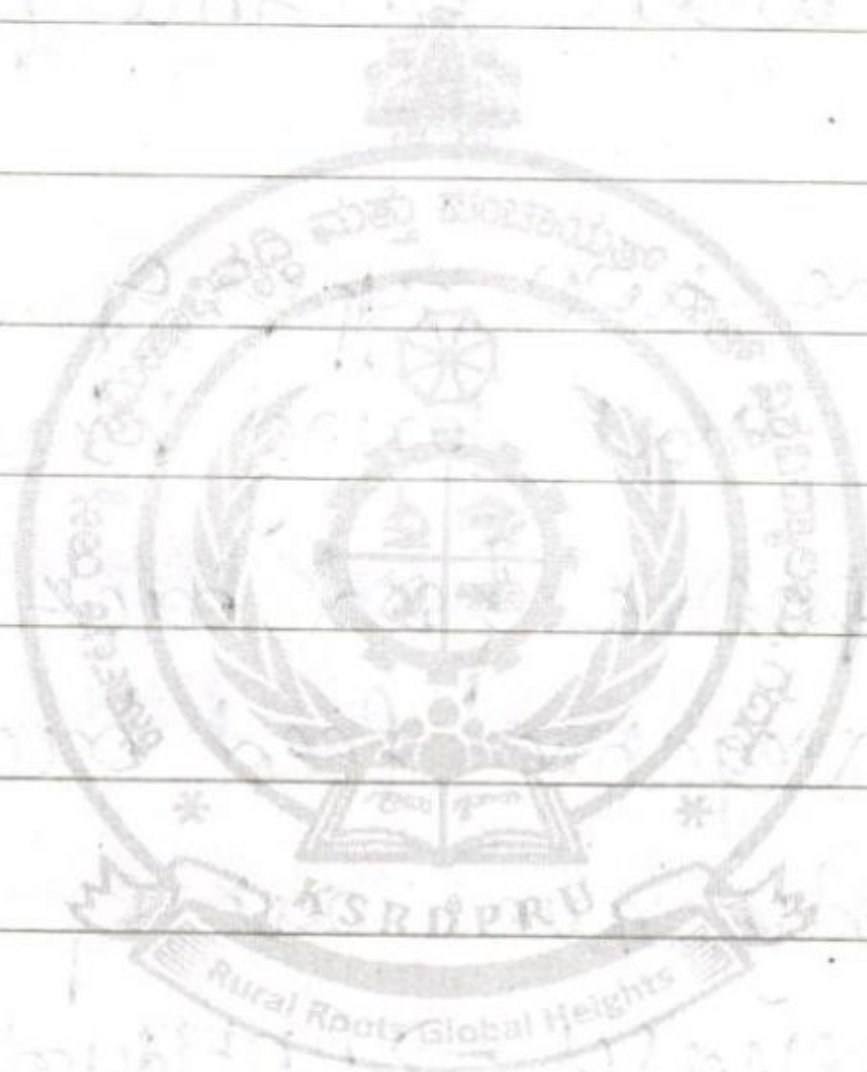

- Negative feed back.

Here when body runs out of water the pituitary glands → releases → Antidiuretic hormone → that signals the kidney to increase water reabsorption from urine → thus making urine more concentrated and the water is sent to blood

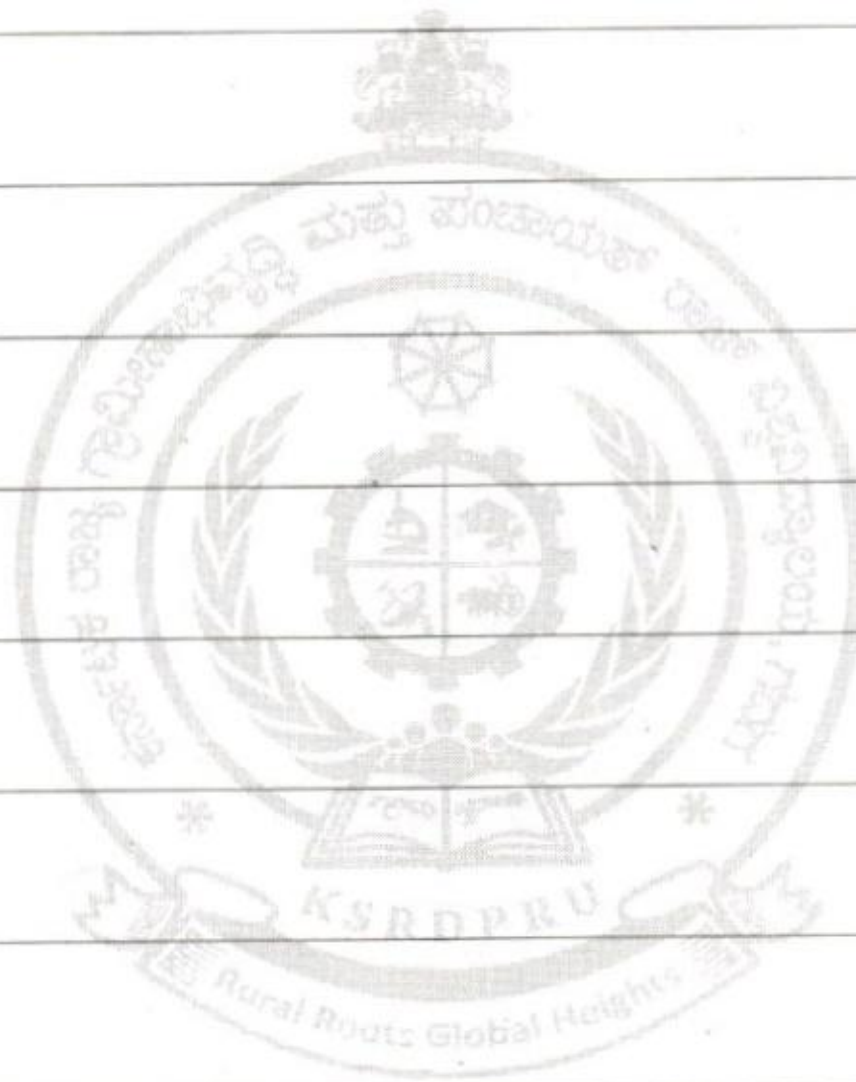

streams → and also increase the feel of thirsty and this rebalance water level in body.

Similarly alteration in pH level cause many harm for body that need to be fixed by homeostasis in a similar way.
