PART - B.

2] cell injury

cell injury caused by various factors like Physical trauma, exposing to the harmful radiation, electrical injury and exposing damage of chemicals and injury from Biological factors and nutrient deficiency.

Etiology of cell injury.

→ Biological factors

• Bacteria

• Fungi

• Viruses

• Parasites

→ Physical

• trauma

• Burn.

• electrical injury

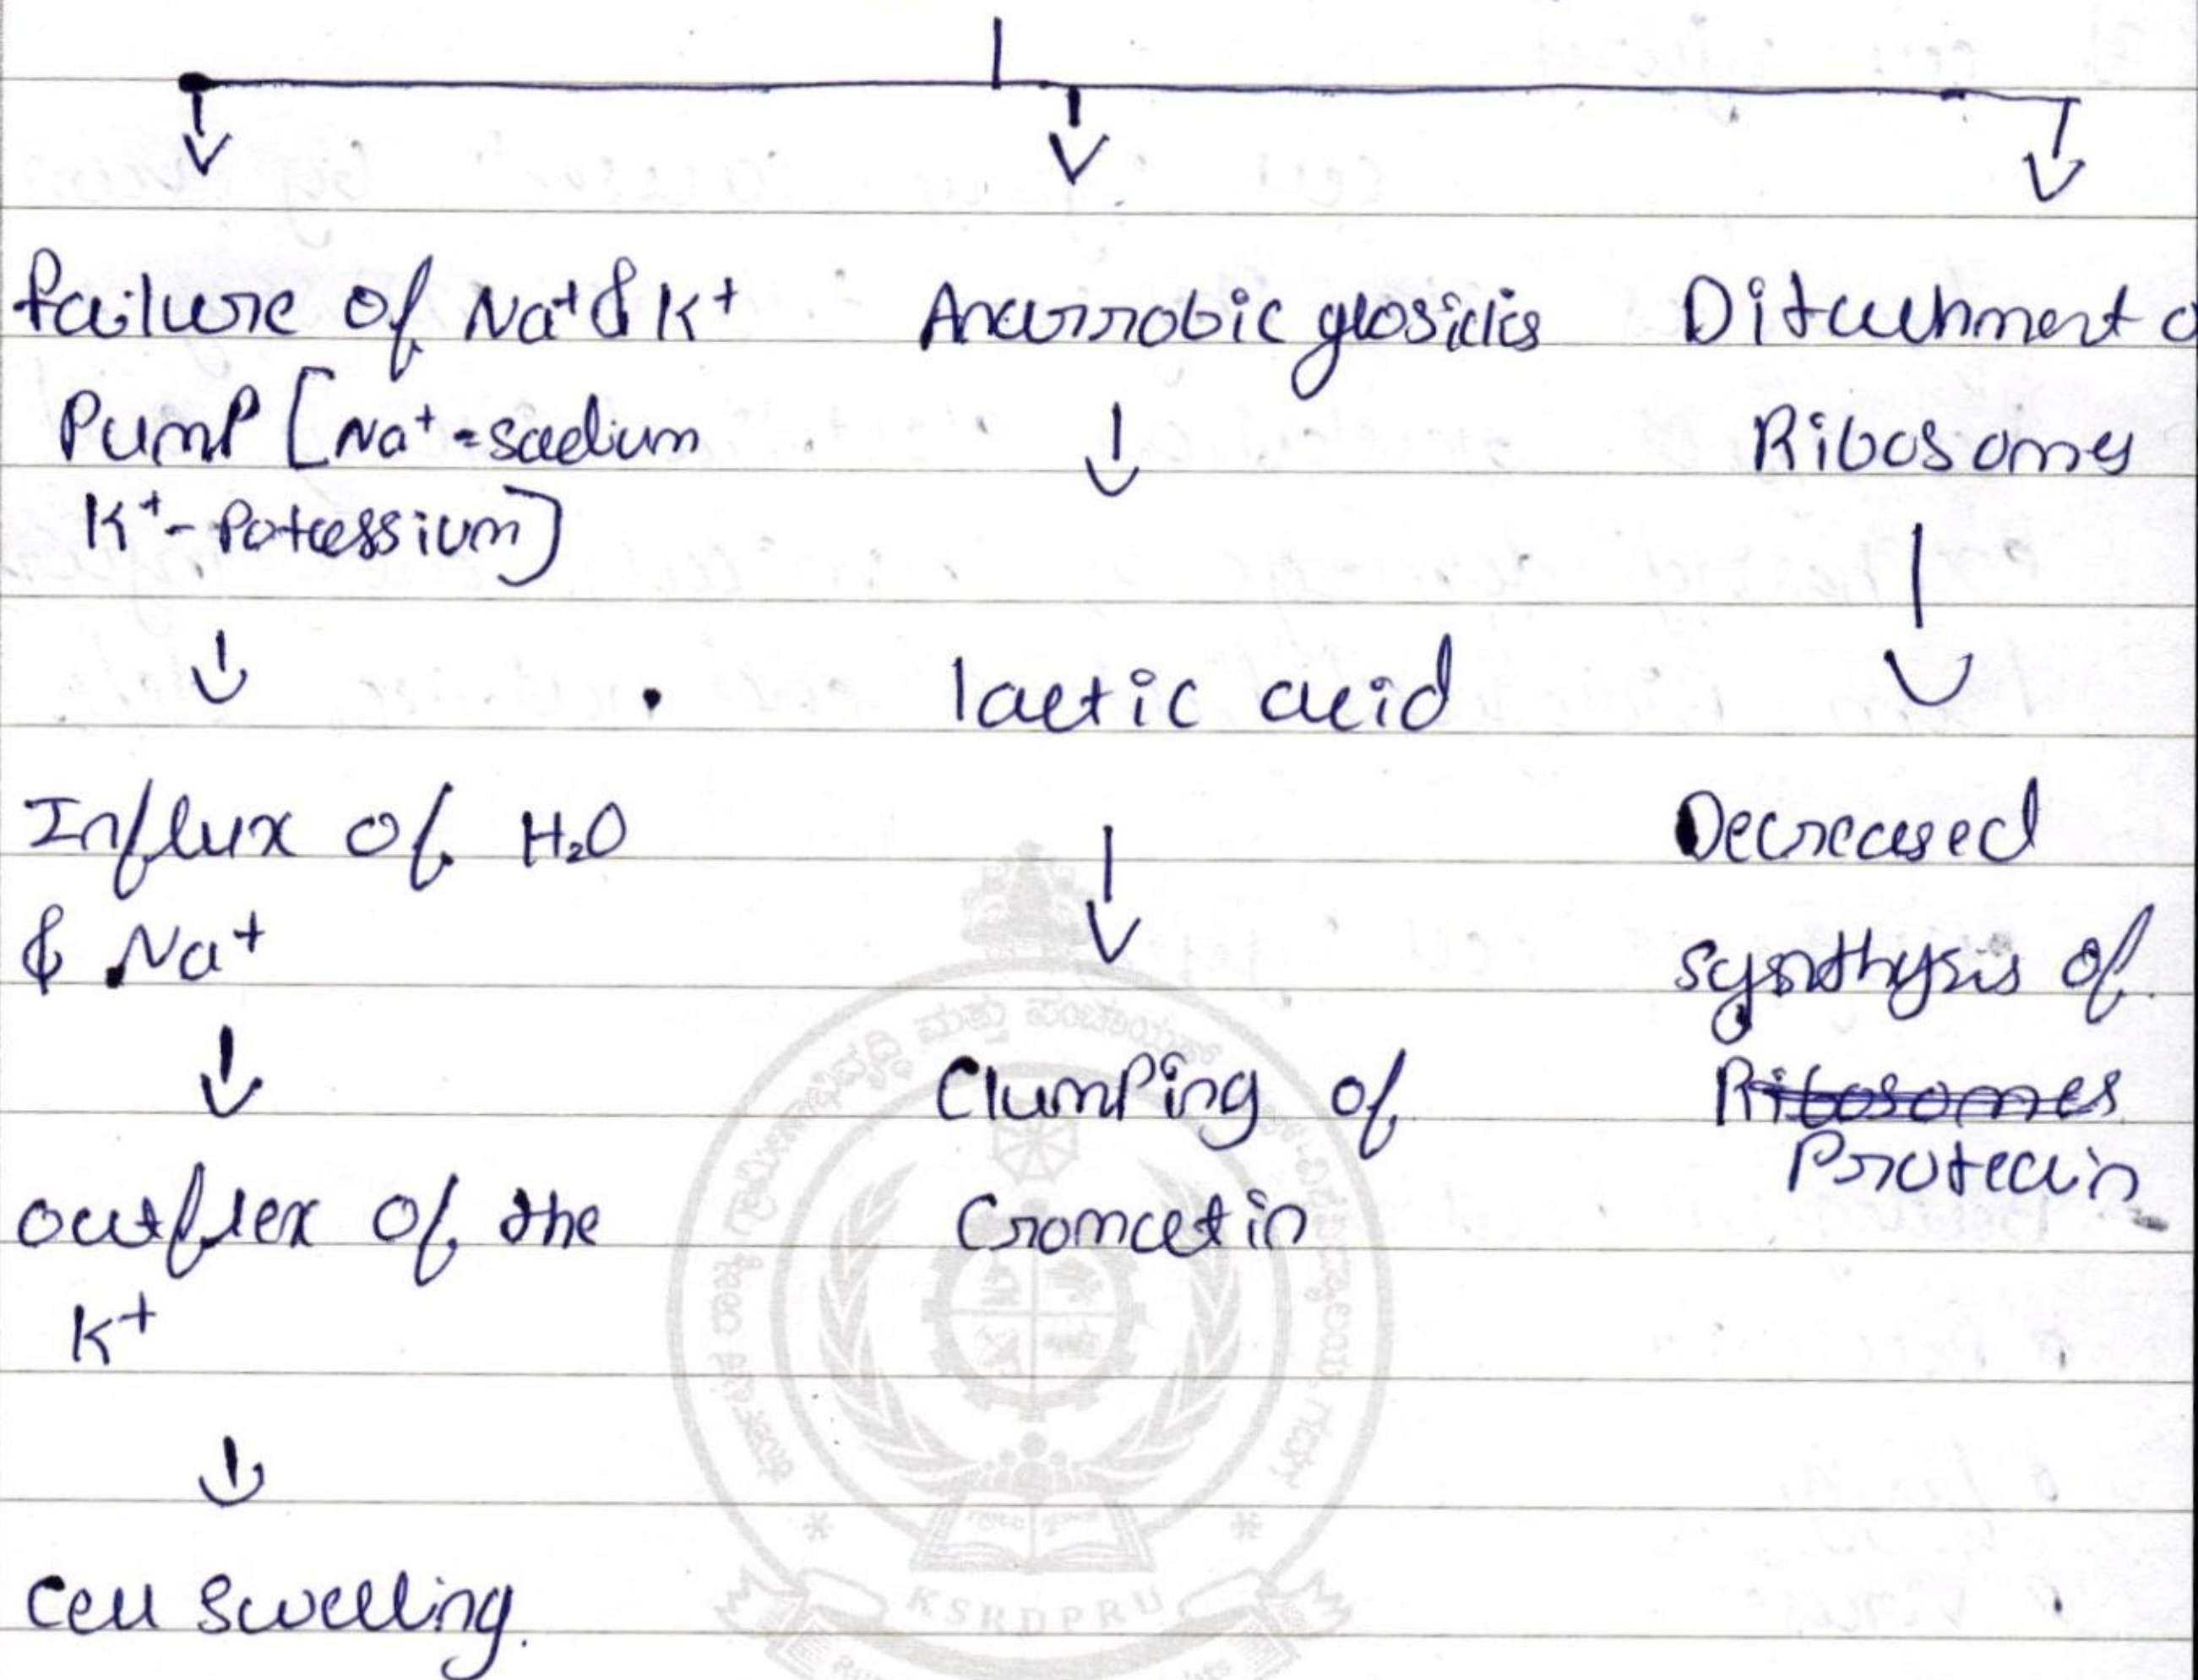

→ nutrient deficiency.

Vitamin A - night Blindness

Vitamin C - Skin.

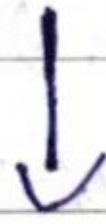

Reversible changes

Decreasing of the ATP formation.

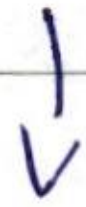

L>

Irreversible changes

Failure of calcium pump

Cytosolic calcium increases

Activation of all enzymes

Phospholipids
(cell membrane)

Proteases
(proteins)

endonucleases
(nucleus)

ATP Phosphatase
(ATP decrease)

Pathogenesis of irreversible changes. First start with the decreasing of the ATP formation and next failure of a sodium and potassium pump and next. Influx of a H_2O and Na^+ after influx of these two that leads to the outflow of a potassium it leads to the swelling of the cell.

Anaerobic glycolysis leads to the lactic acid and starts the clumping of the

chromatin and then the Detachment of the Ribosomes and ~~the~~ the job of a Ribosome is to Synthesis of a protein. So if Ribosomes detached then the Synthesis of Ribosomes stops this leads to reversible injury

In Irreversible injury that starts with the failure of calcium pump and after failure of calcium pump the cytosolic calcium increases and it starts activating the all enzymes like the phospholipase C membrane and the. Across the ~~permeability~~ proteins and the endoplasmic reticulum then the ATP Phase in the ATP starts decreasing.

4) malaria

malaria is a communicable disease and it spread through the female anophelis mosquito and the agent is Plasmodium it cause the malaria and it spread the the mosquito In this disease there are two hosts one is mosquito and the another one is the human being.

Symptoms of malaria

- fever
- Headache
- Body ache
- Vomiting.

malaria spread through the female anophelis mosquito we need to destroy the breeding places of this mosquito this mosquito takes birth in stagnant water it may it spread more in the rainy seasons.

India implemented national malaria elimination programme under that programs lot of malaria diagnosing and provide the services to the peoples and making

surveys

→ Diagnose

We need to diagnose the malaria infected person by making survey if they having the fever and vomiting we need to collect the blood sample of the person and send it into the laboratory.

→ Breeding Places of anopheles mosquito

it mainly takes birth in the stagnant water, in Ponds, roadside canals old tyres, and waste buckets and many more. it mainly increase in the rainy season. ~~So~~ in that season there is storage of water so that purpose.

→ Prevention.

* Using mosquito nets.

* Destroying the breeding places of mosquito.

* making awareness on the community about the disease.

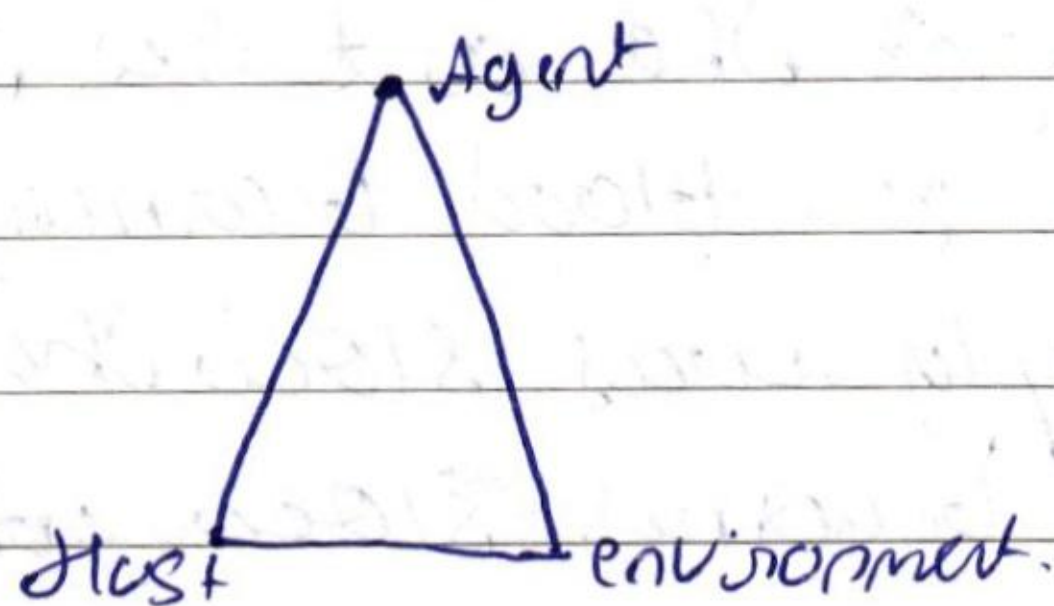

* maintaining the cleanliness at the surrounding of our house.

* Fogging

* wearing full sleeve shirts in the home.

when we suffering from symptoms then we need to rush away to the hospital and. @ making confirmations of that is it malaria or just symptoms it helps and save us from big trouble. treatment for malaria is ACT they provide this and give treatment to each and every one. it is very helpful and the ASHA (Agriculted Social Health Activist) plays major role in the spread & control of the disease because if they do the survey correctly destroy the breeding places of the mosquito then chance of control otherwise disease spread widely and. Problem to the health department again.

→ Epidemiological triad of malaria.

- environment - [rainy season mostly commonly]
- Host - [mosquito & human being]
- agent - [Plasmodium]

6) atherosclerosis

atherosclerosis is the chronic inflammation that cause when the cholesterol starts staying in the arteries and the inner part of the arteries get damage ~~when~~ when the cholesterol stored in the part of arteries & blood flow to the heart decreased so the mi (myocardial infarction may cause).

→ Symptoms

- * Chest Pain
- * Shortness in breathing.
- * Pain in the limbs.
- * Cause Heart attack and Stroke.
- * Obesity.

when the cholesterol starts collecting inside the arteries then the flow of the blood becoming slow if blood supply was slow then the Pumping of Heart becomes slow. when

if some suffering from the chronic disease like Hypertension, Diabetes then are the main characters for this disease because if they are having then the occurrence of Atherosclerosis is very.

nowadays lot of people addicted to the bad habits like smoking and Alcoholism it also may be cause for the atherosclerosis and the people are not following the healthy diet they intake lot of cholesterol into the body that cholesterol stays in the blood vessels the cause MI.

→ Prevention

- following proper diet
- if you are suffering from any chronic disease like, diabetes, hypertension it must be in control.
- Stop smoking and drinking alcohol.
- not eating of a cholesterol more food.
- Physically Active.
- come under of medication.

It is most commonly appears in the mid aged people and who are suffering from the obesity when do the hard work and without taking rest then the chance of the atherosclerosis and it is the cardiovascular disease.

if someone suffering from the Chest pain & we need reach to the hospital and take treatment for the chest they first do ECG and if the find out any variations on the ECG then they takes u under the ultrasound then we get to know whether it is MI (myocardial infarction) or just Pain like that. they give aspirin tablet for thickening of a blood of that person.

It most of only seen in the persons who were eating non-veg. because non-veg contains most of the cholesterol and it may lead the atherosclerosis so for the person our diet is always help us and we need go to gym or do the fitness and play game we need active all the day then helps lot in this case. So this is how the atherosclerosis work.

(7) Autoclave.

Autoclave helps to maintain the sterilization of the cotton, gauze and pads at the hospitals. It helps in removing all harmful pathogenic which can harm for the human body and that kill the bacteria and viruses that present in the it basically works like a oven it heats the particles and by that heat the harmful pathogens were die through it.

majorly it was used in the hospitals and PHCs and Clinics it ~~most~~. ~~when~~ it helps to maintain the sterilization of the product when something ~~is~~ ~~is~~ going ~~for~~ ~~an~~ operation was taken then they use all sterilized items, including the, dress, equipments, cottons, gauze, pads and every single thing that enter to the inside the human body that must be sterical and it should be checked before it enters inside the human body because if that was not fully sterical then the chance of spreading of the disease is very high.

if they were not sterilized then the harmful pathogenic agents enter into the human body and they may cause more disease and more symptoms. So for the sterilization the Autoclave machine needed. It is very important.

It ~~starts~~ runs by the electricity below of the machine. Some water were there and after use the water we need to autoclave that ~~water~~ that. Show the temperature of heating and it showing at when the autoclave was being complete so it vissees when the autoclave was complete.

majorly it was used in the hospitals and other where it helps for the maintain the sterilization that leads good health stop spreading more disease and used for in the operation theater and the using in the dressing. So the another uses of the autoclave.

PART - C

9) rabies

Rabies is communicable disease that spreads from the infected dog to human being. when it was being bitten to the human being.

It was mainly increase in the area where most of street dog were living. if that one infected dog bites to the another dog then that dog is also infected by the rabies and again if bite to the any human he may suffer from the rabies.

lot of works were doing to prevent the rabies there is a vaccine called anti-rabies vaccine. and it was very helpful if we have our pet dog. then we need to vaccinate the dog with the these vaccine because these vaccine prevent the rabies and stop spreading of the disease then everyone will be suffering.

when ~~the~~ we have more street dogs in our area if we get bitten. we need go to the nearest PHC or Hospital. they provide the proper treatment for the rabies

if it was bitten to us first we need wash that site where the dog was bitten we wash properly. It helps to remove the saliva of that dog and then we need to go to the nearest Hospital or PHC and take a proper treatment for the dog. every dog bite is not a rabies because if the dog was infected by the rabies then also we get rabies otherwise no need to fear

The dogs looks aggressive and barks a lot and they are going to the dogs the saliva was coming out from the mouth of the dog. then they have chance of having the rabies disease.

now a days in india from municipality they were requiring the dogs which looks different in colour which makes harm to the society that type of dogs we require by the government and providing the treatment to them it helps lot in controlling of rabies disease because if the dog was being required it helps to the community, if it was not then it may bite many people and it may bite many dogs and spread the virus how much it can so requiring and controlling of rabies is very important.

by using the Anti-rabies vaccine it should be come under control if street dogs also gets the vaccines. it is very difficult job but in future if it happens then the rabies disease should come under control of the government and many ~~times~~ ^{times} many ~~will~~ ^{will} vaccination of the dogs and ~~making~~ ^{making} awareness about the dogs is very important in this phase.

II) Inflammation

Inflammation means a sudden response of a body's immune system. It releases WBC (white blood cells) to the site where you get the injury or cut. If it was burn it helps in the protecting against the harmful pathogenic agent like viruses, bacteria, parasites. It helps to protect against them.

Inflammation ~~helps~~ ~~is~~ ~~the~~ has two types.

- ① Active inflammation
- ② Chronic inflammation

Active inflammation

In Active inflammation is give sudden response of a from the human immune system and sends the WBC and antibodies to the site where we get injured and get a check of entering the harmful pathogenic agents like viruses, bacteria, fungi and

other antibodies means it was the protein prepared by the human body to gets a protection against the foreign bodies like bacteria, viruses and parasites that harm your body and the WBC (white blood cells) mainly for it was present in blood. main function of this WBC is to fight against the harmful pathogenic agent that can enter through the cuts and wound. So In active inflammation it mainly work as the protective agent and Active inflammation gives a sudden response to the human immune system and make to prevent the disease.

Example for Active inflammation

- * Cuts
- * wound
- * burn
- * needle wound
- * Scatches on the limbs

→ Chronic inflammation

Chronic inflammation that is the long term treating process it may take

One week, one month and one year it was the long process of curing of diseases for example cardiovascular diseases that was the non-communicable and chronic diseases it basically helps in the maintenance of the good health of the disease if there is outbreak and loss of limit then the chance of survival is too high and the chronic inflammation reduces the diabetes and hypertension that are seen in these diseases from very long time this shows the chronic diseases work the curable is very low thick it was not curable until we die we need take the medication and follow the diet and making physical activity less sugar helps in the control of the Diabetes and many more diseases are example for chronic inflammation diseases

example of chronic inflammation

- ① cardiovascular diseases
- ② Diabetic
- ③ Hypertension
- ④ obesity
- ⑤ orthopedic cancer and many others

(12) anemia.

It is mainly most commonly found in the pregnant women when they start in high and their weight was very less if they are very thin then the chance of having anemia is very high.

So during pregnancy, they check the high and weight of the women for future complication it is considered as a high risk pregnancy. If the ~~mother~~ woman was anemic ~~the~~ health department provides the iron folic acid to the lady and provide the nutritious food to the mother. It helps to maintain the good health of a lady and mother also. If the mother was not taking these tablets and eat correct nutritious food then it is very risk mother and the children may die from anemia. It is very dangerous disease. We need aware about this. While pregnancy we need intake the nutritious food and dry fruits which influence towards our good health. We need to follow all these foods.

29844

In Asha workers handle this
 type of cases very smoothly why
 now the MMR mother mortality rate
 is very less they provide proper nutrients
 and sufficient drugs to the lady and
 make them to eat high protein food.
 Some belong in the poor family they
 can't eat the nutritional food. so
 for that purpose government of India
 supply the supplementary nutrients so that
 lady who were suffering from anemia.

anemia basically found
 in the short ladies and who were
 very thin & they mostly commonly
 suffer from this disease and it was
 really bad if they are having this disease.
 then the health workers find out and
 put them in a risk pregnancy then
 they take extra care about the
 her and make her to come out from
 that anemia disease it was caused
 by the lack of nutritional do not ~~resists~~
 eating the nutritional food.

Anemia is the disease which pregnant lady suffer from more nutrients while during pregnancy ~~they~~ from the government they provide iron folic acid tablets and provide good nutritional food and check her weight of her every month take extreme care about mainly the weight considered as a high risk pregnancy. So for that anemia is the one of the dangerous disease it can harm the life as well so we need awareness of this disease and need to eat ~~in~~ good nutritional food.

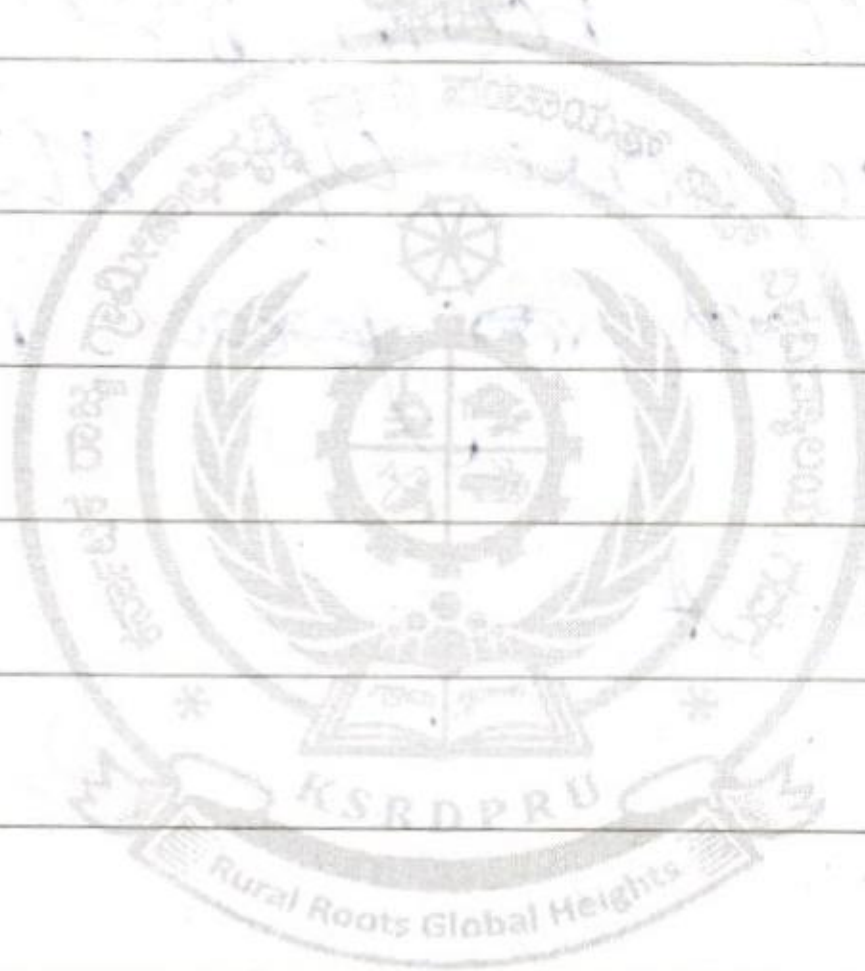

PART A

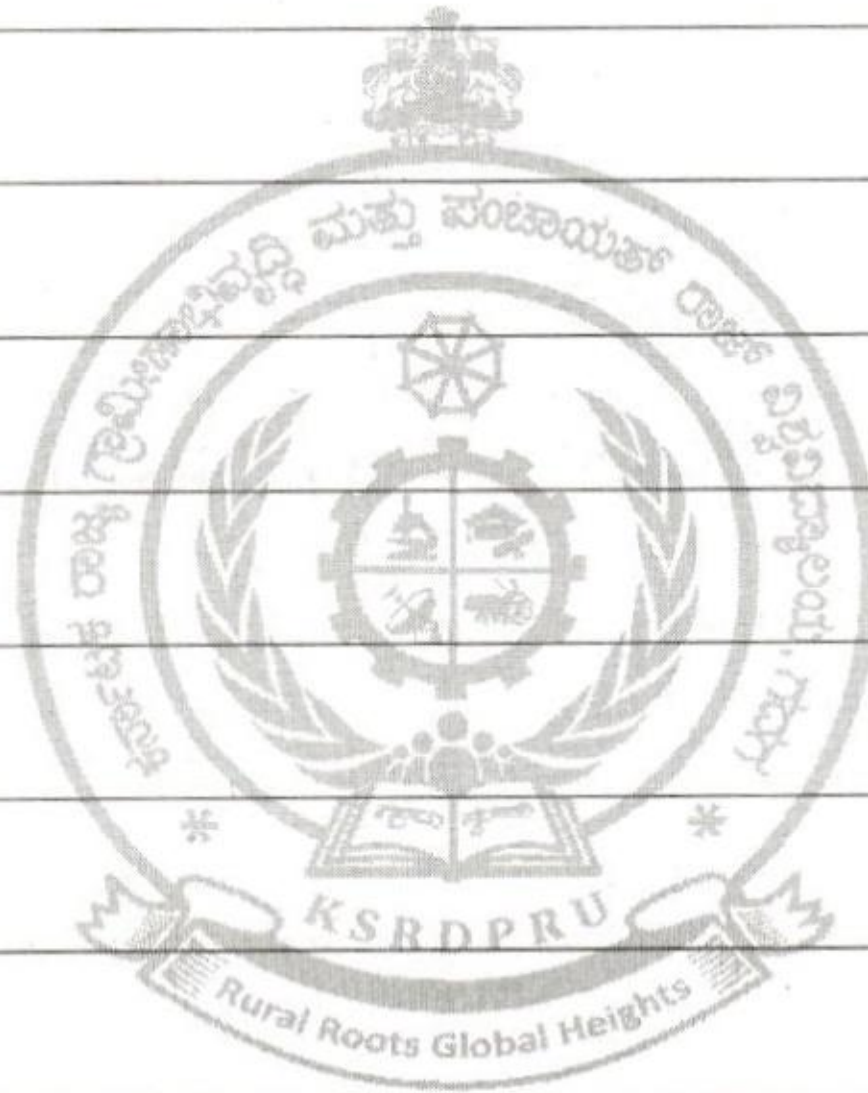

b)

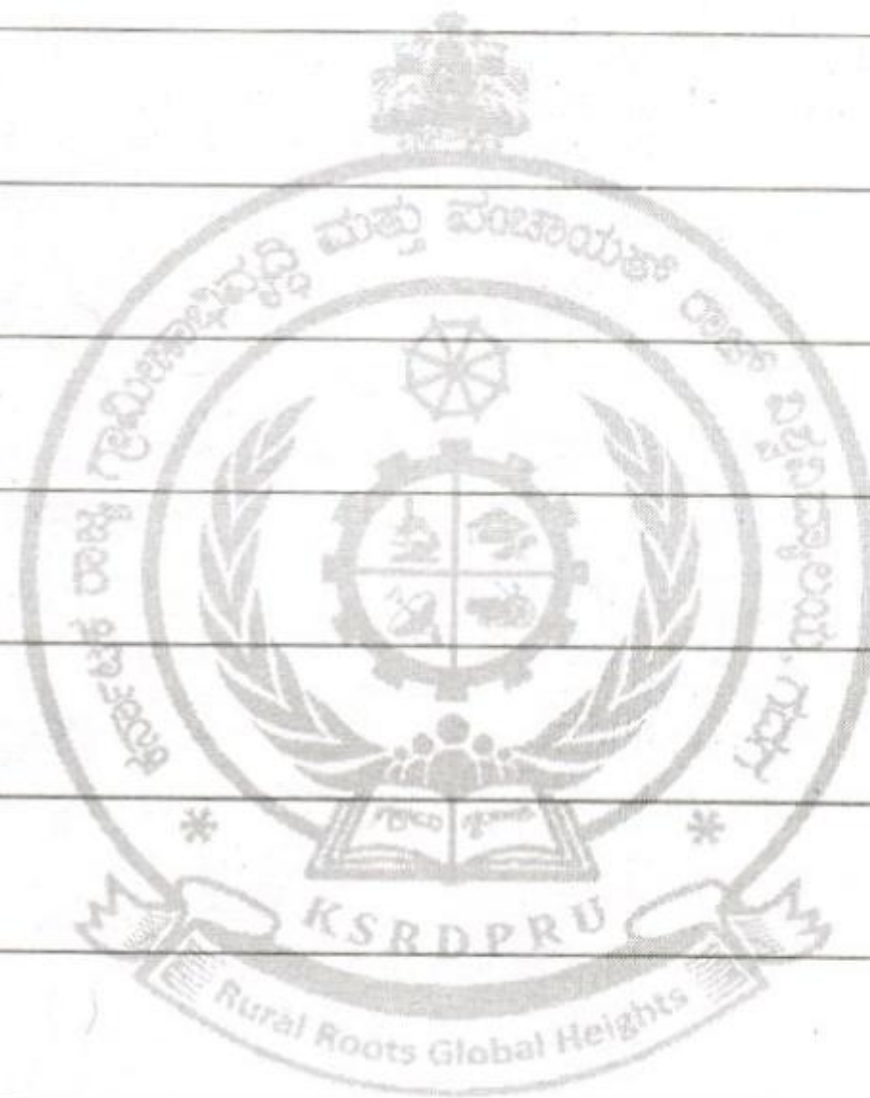

c) Active Sterilization
Passive Sterilization

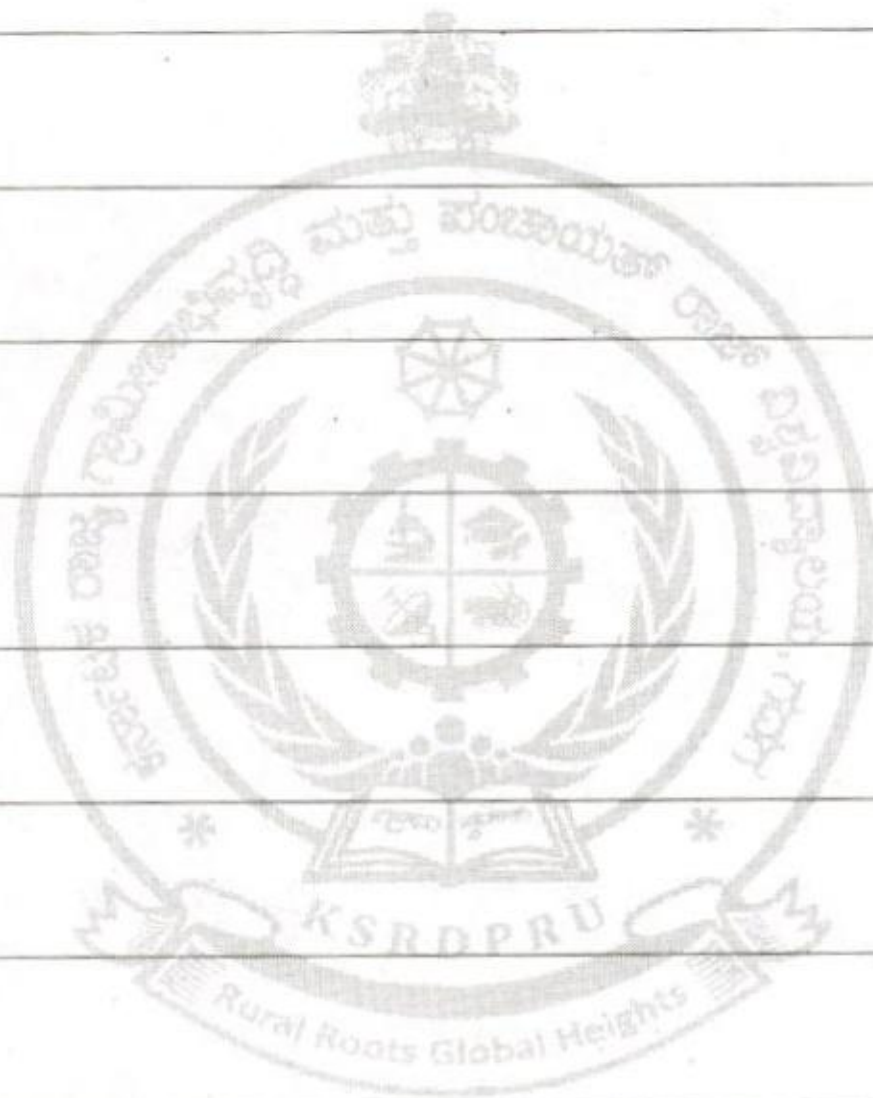

d) wearing foot wear.

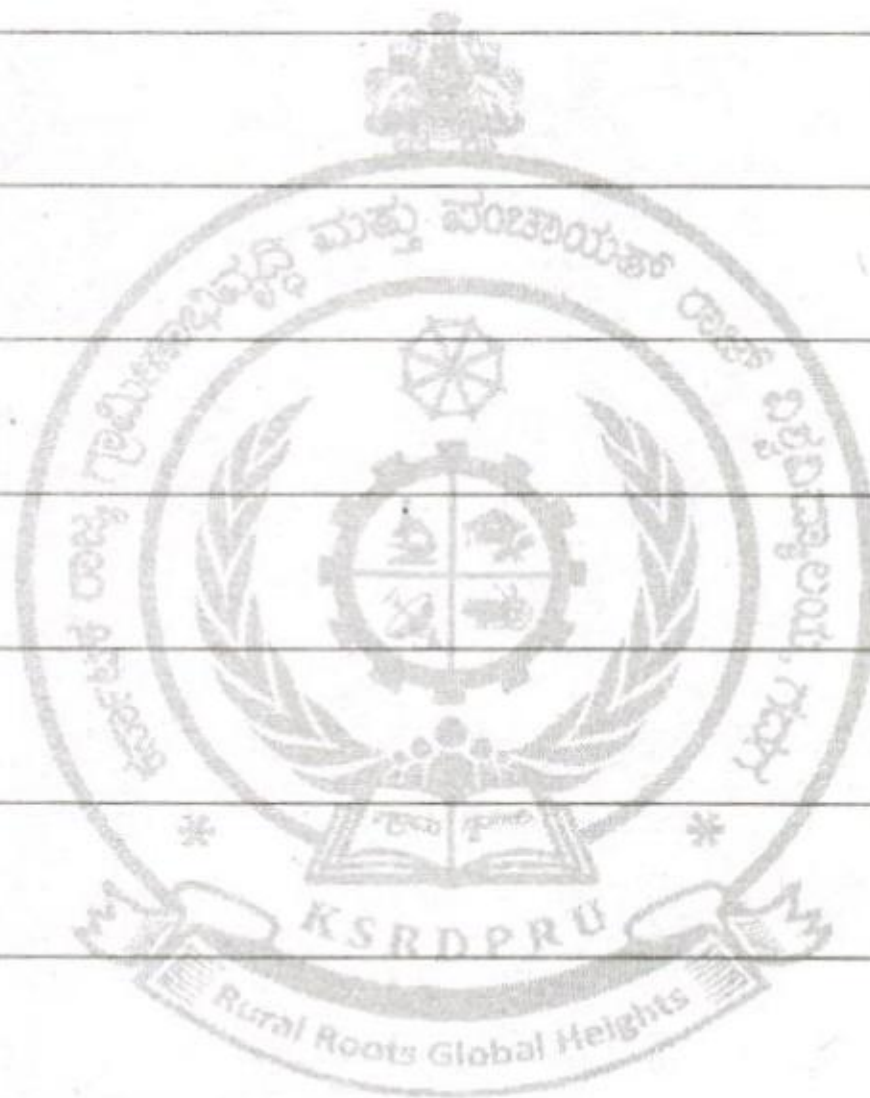

• if we have wound on a foot we need to cover properly by bandage of dress wound.
